# Executive Summary

## **Senate Bill 743 (SB 743) fundamentally changed transportation impact analysis under the California Environmental Quality Act (CEQA).**

On September 27, 2013, Governor Jerry Brown signed SB 743 into law and started a process intended to fundamentally change transportation impact analysis under the CEQA. Specifically, the legislation directed the State of California's Office of Planning and Research (OPR), which oversees CEQA compliance, to consider different metrics for identifying transportation impacts and make corresponding revisions to the *CEQA Guidelines*. The goal of this legislation and the pursuant change in metrics was to reform transportation impact analysis such that it was more in line with other statewide goals pertaining to infill development, reduction of greenhouse gases (GHG), and promotion of public transit and active transportation.

As a result of changes to the *CEQA Guidelines* there are several changes in general transportation impact analysis metrics, methods, and thresholds. As a lead agency, the Town of Los Gatos will need to make several policy decisions to implement these changes. This document discusses the background of the changes, and provides detailed technical information pertaining to decisions the Town will need to make. The **Summary of Decisions, Options, and Recommendations**, presented as **Appendix A** and in the matrix at the end of this Executive Summary, provides an abbreviated overview of this documents' contents and corresponding action items and decision points.

At the end or within Chapters 3 through 6, the decision options, limitations and considerations are summarized, which matches the decisions matrix (**Appendix A**). Also included in these summaries are two draft threshold recommendations. These recommendations were presented to Town Council on February 18, 2020 as the following options:

- Option 1: Rely on the OPR *Technical Advisory* thresholds
- Option 2: Set thresholds consistent with the General Plan future year VMT projections

Since the Town Council hearing, Caltrans released has released its draft *Transportation Impact Study Guide* (February 28, 2020) endorsing the VMT thresholds published in the OPR *Technical Advisory*. Caltrans does acknowledge that each lead agency has the discretion to set its own significance thresholds, and they will be reviewing the evidence presented by any agency that uses a threshold that differs from those in the *Technical Advisory*.

To help explain the threshold options in more detail, each section of the document package includes a description of these thresholds.

## Background

### **VMT replaces vehicle delay as an indicator of environmental impacts.**

At its core, SB 743 removes the use of vehicle level of service (LOS) as an indicator of environmental impacts under CEQA. LOS is a traditional measure of vehicular delay, or the additional driving time encountered by drivers during congested time periods. Instead of measuring vehicle delay, OPR recommends considering a project's effect on total vehicle miles traveled (VMT).

VMT can briefly be described as the product of a project's vehicle trip generation and the average length of those trips. For instance, if a project generates 100 daily vehicle trips, each with an average length of five miles, that project generates 500 daily VMT.

VMT is related to many of the side effects created by vehicle travel. In gasoline or diesel powered vehicles, VMT is directly related to total GHG production and other tailpipe emissions. VMT also serves as an indicator of total regional congestion by measuring how much traffic a project is generating on a macroscopic scale.

However, VMT does not accurately predict changes such as increased delay at intersections near a project, or how traffic will affect roadways immediately surrounding a project, in the same way traditional traffic analysis would. It is more focused on how efficiently designed and located a land use project might be; whether the project is located near a wide variety of jobs, housing, or retail uses; and whether alternative modes of transportation are available.

### **As a lead agency, the Town must make several key policy decisions to comply with SB 743.**

Because reporting the VMT associated with a given project or plan requires a different method than traditional traffic analysis, the Town will need to set clear guidelines and expectations for how a VMT analysis should be conducted. With the *CEQA Guidelines* expectations for an environmental impact analysis in mind, this document discusses several questions, grouped by the specific decisions about VMT metrics, VMT calculation methods, VMT significance thresholds, and VMT mitigation actions.<sup>1</sup> We highlight options and limitations for each question from a technical transportation planning and engineering perspective with a particular emphasis on addressing the *CEQA Guidelines* expectations for an environmental impact analysis.

1. **VMT Metrics:** What form of VMT metrics could be used?
2. **VMT Calculation Methods:** What methods are available to use in estimating and forecasting VMT?
3. **VMT Impact Significance Thresholds:** Is the use of VMT impact screening desired? What is the VMT impact significance threshold for land use projects and land use plans under baseline conditions? What is the VMT impact significance threshold for land use projects

---

<sup>1</sup> Typical CEQA practice focuses on environmental effects that occur on a typical weekday, so all references to VMT in this document are intended to mean VMT that occurs on a typical weekday.

under cumulative conditions? What is the VMT impact significant threshold for transportation projects under baseline conditions?

4. **VMT Mitigation Actions:** What VMT reduction mitigation strategies are feasible?

Each of these questions is discussed in greater detail in its own section of this document, along with a section discussing other aspects of the CEQA process that may be affected by these changes. Those sections are summarized below.

## VMT Metrics

### VMT can be measured and expressed in multiple ways.

The first decision facing the Town is which VMT *metric* to use to express a project's transportation effects. VMT metrics fall into two general categories: absolute VMT and per capita VMT. Per capita VMT is also referred to as an efficiency metric, as it does not vary directly with project size. Based on our example above, if a project generates 100 daily trips at an average of five miles per trip, the *absolute* project generated VMT is 500 vehicle miles per day. If that project is a small office employing 25 people, the per capita VMT is 20 VMT per employee (a per capita or VMT efficiency metric).

**Table ES-1** summarizes the common VMT metrics available to the Town.

Table ES-1: Summary of Common VMT Metrics			
VMT Metric <sup>1</sup>	Definition	Recommended by OPR <sup>2</sup>	VMT used for other CEQA Sections?
<b>Total Project Generated VMT</b>	Daily VMT of all vehicle trips, vehicle types, and trip purposes for all project land uses, presented as a total project generated VMT.	Yes, for land use plans, and discussed in Appendix 1 of the OPR <i>Technical Advisory</i> .	Yes
<b>Total Project Generated VMT per Service Population<sup>3,4</sup> (aka Total Project Generated VMT Rate)</b>	Daily VMT of all vehicle trips, vehicle types, and trip purposes for all project land uses, divided by the sum of residents plus employees.	No, although may be helpful for mixed-use projects and comparing land use scenarios, particularly when using a travel forecasting model.	Yes
<b>Partial Home-Based VMT per Resident<sup>5</sup> (aka Home-Based VMT Rate)</b>	VMT generated by light-duty vehicles for all trips that begin or end at a residential land use, divided by residents.	Yes, for residential projects on page 5 and Appendix 1 of OPR <i>Technical Advisory</i> .	No

**Table ES-1: Summary of Common VMT Metrics**

VMT Metric <sup>1</sup>	Definition	Recommended by OPR <sup>2</sup>	VMT used for other CEQA Sections?
<b>Partial Home-Based Work VMT per Employee<sup>5</sup> (aka Home-Based Work VMT Rate)</b>	VMT by light-duty vehicles only for work trips (that is, trips that have one end at a workplace and one end at a residence), divided by number of employees.	Yes, for office projects on page 6 and Appendix 1 of <i>OPR Technical Advisory</i> .	No
<b>Project's Effect on VMT within the Boundary of a Specific Area (aka Boundary VMT)</b>	VMT that occurs within a selected geographic boundary (e.g., Town/City, County, or region) by any type of vehicle. This captures all on-road vehicle travel on a roadway network for any purpose and includes local trips as well as trips that pass through the area without stopping.	Yes, for retail projects and transportation projects on pages 5, 6 and 23 and Appendix 1 of the <i>OPR Technical Advisory</i> .	Yes

1. Each VMT metric is an option for baseline and/or cumulative impact analysis.
2. With the exception of Total Project Generated VMT per Service Population, each VMT metric listed in this table are described in the *OPR Technical Advisory on Evaluating Transportation Impacts in CEQA* (December 2018). See pages 5, 6 and 23, and Appendix 1 of the *OPR Technical Advisory*.
3. Total project generated VMT is derived from this VMT rate.
4. The project generated VMT accounting is similar to an origin-destination accounting used for many Climate Action Plans.
5. A partial VMT estimate.

Source: Fehr & Peers, 2020.

## Total VMT and Partial VMT

Total VMT metrics include all types of VMT captured by a travel forecasting model, regardless of the type of vehicle or the trip's purpose. In practice, this means the metric includes visitor trips, medium-duty and heavy-duty vehicles, public transit buses, and other types of vehicle miles that might not be captured in the most common partial VMT metrics. Partial VMT refers to the use of only particular trip purposes and/or vehicle types for assessing a project's impacts. The efficiency metrics recommended by OPR for use in analyzing office and residential projects are partial VMT metrics, because they include only light-duty passenger vehicles and only trips for a specific purpose or made by a specific population.

The benefit of partial VMT metrics is that they allow for sketch-level analysis using findings from a prior model run, they are easier to understand and visualize, and for single land uses that are similar to existing development patterns they are likely reflective of the same impact patterns as would be present with analysis of total VMT. Understanding where built environment conditions lead to VMT-efficient residential and workplace activity is substantial evidence that could help support conclusions that adding similar land uses to those areas would create similar outcomes. For projects that may be subject to further scrutiny, only reporting a portion of VMT from select trip purposes and limiting the VMT to light-duty vehicles could be considered an incomplete analysis of VMT.

## Project Generated VMT and Project's Effect on VMT

VMT metrics also differentiate between project generated VMT and a project's effect on VMT. Project generated VMT is similar to current transportation impact analysis practice of using daily trip generation: to estimate the daily project generated VMT, the daily trips are multiplied by the distance traveled by each daily vehicle trip. The project's effect on VMT instead evaluates the change in total on-road travel within a geographic area boundary before and after the project is built (referred to as boundary VMT in this document). An often-cited example of how a project can affect VMT is the addition of a grocery store in a food desert. Residents of a neighborhood without a grocery store have to travel a great distance to an existing grocery store. Adding the grocery store to that neighborhood will shorten many of the grocery shopping trips and reduce the VMT to/from the neighborhood. While the new store itself will "generate" many daily trips, in that there will be many cars coming in and out of the store's driveway, it will generally attract those trips *away* from other grocery stores located farther away. If the boundary VMT in the area served by all the local grocery stores were to be assessed, it is likely that the total amount of driving in that area will have decreased rather than increased.

## Key Take-Aways

In deciding what form of VMT metric to use, the Town should consider the following options:

1. Total Project Generated VMT
2. Total Project Generated VMT per Service Population<sup>2</sup>
3. Household generated VMT per Resident (requires an activity/tour-based travel forecasting model)
4. Home-Based VMT per Resident (a partial VMT estimate)
5. Home-Based Work VMT per Employee (a partial VMT estimate)
6. Project's Effect on VMT within the Boundary of a Specific Area (Boundary VMT)

Metrics such as Home-Based VMT per Resident and Home-Based Work VMT per Employee represent partial VMT (i.e., some vehicle types and trip purposes are excluded from the calculation). This may be acceptable for screening purposes but not for a complete VMT impact analysis. When selecting VMT metric(s), it is useful to keep in mind that the expectations of CEQA is to disclose the potential effects of a project on the environment and the practical consideration of using the same (or different) VMT metrics for the various topic sections of an environmental analysis – transportation, air quality, GHG and energy consumption.

---

<sup>2</sup> Service population includes residential population plus employment and may include students or visitors; it is intended to include all independent variables used in estimating trips.

## VMT Calculation Methods

### VMT can be calculated using several methods.

The most common method of calculating the VMT metrics listed in **Table ES-1** is through a travel forecasting model. A travel forecasting model uses a specialized software and are designed to reflect the interactions between different land use and roadway elements in a large area. The two travel models most commonly used to assess projects in Los Gatos are the Santa Clara Valley Transportation Authority (VTA)-City/County Association of Governments of San Mateo County (C/CAG) Bi-County Model ("VTA Travel Model"), and Travel Model One ("MTC Travel Model") which is maintained by the Metropolitan Transportation Commission (MTC) and used for large-scale regional planning efforts. There is also a statewide model developed by Caltrans, though the level of analysis is at such a large scale that it is typically used to evaluate interregional travel and freight movements rather than localized land use changes.

In some cases where a travel model is not available or not appropriate, VMT can be estimated using sketch models or spreadsheet tools. VMT can also be estimated directly by multiplying the number of trips by an average trip length. Trips can be estimated using the results of local trip generation surveys or published trip generation rate data.

### Key Take-Aways

Practically speaking, the use of a travel model is preferable for projects large enough to be accurately represented in that model. In areas under the Town's jurisdiction, use of the VTA Travel Model is most appropriate for this analysis. **Appendix B** summarizes the activity-based (also called tour-based) MTC Travel Model, and the trip-based VTA Travel Model, including their analytical strengths and weaknesses.

Some limitations of these methods include the following:

- Statewide and regional models have limited sensitivity and accuracy for local scale applications off the shelf.
- Regional and local models often truncate trips at model boundaries.
- Sketch and spreadsheet tools do not capture the "project effect on VMT."

For smaller projects, use of a non-model accounting method may be more appropriate due to their scale and ease of use. The Town may wish to set guidance as to which types of projects will generally be required to perform VMT analysis using a travel forecasting model, and which can be performed using non-model "Accounting Methods" (if any). One potential planning tool that may be appropriate for most small- to medium-sized projects in the forthcoming Santa Clara Countywide VMT Estimation Tool under development by the VTA.

## VMT Impact Significance Thresholds

### **The Town has discretion to decide what constitutes a significant impact to the environment.**

SB 743 changes the focus of transportation impact analysis in CEQA from measuring impacts to drivers, to measuring the impact of driving. The Town has discretion to set its significance threshold for VMT impacts, provided that the basis for that threshold is grounded in substantial evidence. With regard to establishing thresholds for VMT, lead agencies have at least four options:

1. **Use Screening Criteria.** The concept of project screening is that some projects have characteristics that readily lead to the conclusion that they would not cause a VMT impact, and therefore could be screened out of doing a detailed VMT analysis. Some types of screening criteria include transit proximity, low-VMT area, local-serving retail, transportation projects that do not add capacity, and projects with no net VMT increase.
2. **Rely on the OPR Technical Advisory suggestion to set thresholds consistent with state goals for air quality, GHG and energy conservation.** The OPR *Technical Advisory* contains suggested VMT thresholds. The basic suggested threshold is that each project achieves a VMT level that is at least 15% below baseline conditions. In the case of the Town of Los Gatos, its “region” would most likely be the nine-county Bay Area.
3. **Use a threshold adopted or recommended by another public agency consistent with lead agency air quality, GHG reduction, and energy conservation goals.** The *CEQA Guidelines* offer the option for an agency to use a threshold that is adopted or recommended by another agency, as long as that decision is supported by substantial evidence.

Other state agencies, such as Caltrans and the California Air Resources Board (CARB), have technical expertise that is relevant to this topic.

Recent CARB publications have identified that new land use projects could contribute to these statewide goals by achieving total project generated VMT levels of at least 14.3% below the existing baseline (the CARB report does not specify whether this “baseline” is the regional average or some other baseline). For light-duty vehicles only, CARB cites a 16.8% reduction below baseline (2018) average VMT. However, the CARB analysis assumes that all of the regions in the state will meet the GHG reduction targets set in their Regional Transportation Plans and Sustainable Communities Strategies (RTP/SCS); thus far, indications are that not all regions are meeting those targets, and vehicular travel in California (at least prior to the COVID-19 pandemic) has been increasing rather than decreasing over the past several years. Further, the CARB analysis does not account for any future increases in the use of Transportation Network Companies (such as Uber and Lyft) or commercial delivery services, nor does it envision the potential for development of autonomous vehicles or any other emerging transportation innovations. Therefore, there is growing evidence that the VMT

reduction values from the CARB publication may not be enough to actually meet the State's GHG goals. Should current VMT generation trends persist, the threshold may need to increase to 25% below baseline (2018) average of jurisdiction (all vehicles).

Caltrans has released draft guidance endorsing the VMT thresholds published in the OPR *Technical Advisory*. Caltrans does acknowledge that each lead agency has the discretion to set its own significance thresholds, and they will be reviewing the evidence presented by any agency that uses a threshold that differs from those in the *Technical Advisory*.

Separately, Caltrans has released draft Interim Guidance on "*Determining CEQA Significance for GHG Emissions for Projects on the State Highway System*" that recommends that any increase in GHG emissions would constitute a significant impact. This has been referred to as the "Net Zero VMT threshold". While Caltrans has thus far signaled that this threshold would be applied only to transportation projects, it does raise a question about whether a "net zero VMT" threshold should also be applied to land use projects and plans.

4. **Develop jurisdiction-specific VMT thresholds consistent with the existing General Plan.**

Agencies may decide to set their own thresholds, which should be supported by substantial evidence and should support the three objectives laid out in SB 743: 1) reducing GHG emissions, 2) encouraging infill development, and 3) promoting active transportation. The process of setting thresholds should consider the policies and standards set in the Regional Transportation Plan (RTP)/ Sustainable Communities Strategies (SCS), and should consider how much priority the Town wants to place on the statewide GHG reduction goals. A targeted study could determine what level of VMT in Los Gatos would be consistent with the VMT forecasts presented in Plan Bay Area and would represent the Town's "fair share" of the State's GHG reduction goals (as proposed in Town of Los Gatos' SB 743 Implementation Option 2 to set thresholds consistent with the General Plan future year VMT projections). Another option for setting a local threshold is to consider what level of VMT reduction is feasible to achieve in the local context. Setting a threshold based on the feasibility of mitigation may not be fully supported by past CEQA practices; Fehr & Peers advises consulting legal counsel and continuing to follow legal developments before adopting this approach.

## Key Take-Aways

While it is difficult for a lead agency to determine what level of VMT change is unacceptable when viewed solely through a transportation lens, there are several possible options depending if the Town chooses to set a threshold based on local or state policies. Options include:

1. Set thresholds based on state goals
  - a. Rely on the OPR Technical Advisory suggestion to set thresholds consistent with state goals for air quality, GHG and energy conservation.
    - i. OPR 15% below baseline average of a town/city or region (light-duty vehicles only)

- b. Use a threshold adopted or recommended by another public agency consistent with lead agency air quality, GHG reduction, and energy conservation goals.
        - i. CARB 14.3% below baseline (2018) average of jurisdiction (all vehicles, presuming that MPOs meet SB 375 targets)
        - ii. CARB 16.8% below baseline (2018) average of jurisdiction (light-duty vehicles only, presuming that MPOs meet SB 375 targets)
        - iii. CARB: 25% below baseline (2018) average of jurisdiction (all vehicles, presuming that MPOs do not meet SB 375 targets).
        - iv. Net zero VMT (pending Caltrans-recommended threshold)
  2. Set jurisdiction-specific threshold consistent with existing General Plan
    - a. Set jurisdiction specific VMT threshold based on substantial evidence
    - b. Set thresholds based on baseline VMT performance and based on substantial evidence

## VTM Mitigation Actions

### The nature of transportation impact mitigation under CEQA will likely change.

Mitigating a LOS impact typically involves making changes to the physical transportation system in order to accommodate additional vehicles and reduce delays. These mitigations may involve actions such as installing traffic signals, adding turn lanes, widening roads, or contributing to the construction of HOV/Express Lanes, among other options. The identification of necessary mitigations resulting from project impacts has historically led to project sponsors identifying and funding these changes to the transportation system (i.e., paying a “fair share” contribution toward funding a new traffic signal or widening an existing roadway).

The use of VMT as a metric focuses on the total *amount* of driving, rather than the driving *experience*. Four possible mitigation approaches are described in the following sections:

- VMT Cap
- VMT Based Impact Fee Program
- VMT Mitigation Bank
- VMT Mitigation Exchange

A VMT Cap can be developed and administered on a project-by-project basis, while the remaining three options (VMT Based Impact Fee Program, VMT Mitigation Bank, and VMT Mitigation Exchange) are program approaches to impact mitigation. The concept of a ‘program’ approach to impact mitigation is commonly used in a variety of technical subjects including transportation, air quality, GHG, and habitat. Transportation impact fee programs have been used to help mitigate cumulative vehicle level of service (LOS) impacts. What is new is developing a fee program based on VMT impacts and alternative programs – VMT Mitigation Bank and VMT Mitigation Exchange. Absent these new program-level mitigation

approaches, rural and suburban lead agencies will have limited feasible mitigation options for project sites.

## Use of Vehicle Level of Service for Non-CEQA Analysis

### **The Town has options to continue studying a project's effects on vehicle delay.**

Communities place a high value on the information about traffic and transportation presented during a project's review process. Historically, much of the transportation analysis associated with new development or proposed land use plans has occurred under the umbrella of CEQA. However, with this new process, many of these guidelines and analyses will instead occur during development review as part of the Town's overall entitlements and project review process.

The Town may decide to maintain a level of service standard in its General Plan or Transportation Element and may continue to administer programs to collect impact fees that can be used for roadway improvements. However, these will no longer be subject to CEQA-level review and litigation. Instead, this analysis and any related agreements would need to be performed and presented during entitlements or development review. Any fees assessed to help ease the effects of a given project would be required to conform to state requirements for impact fees and present an appropriate study that identifies nexus between the impact and the fee assessed.

## Other Core CEQA Tenets Remain Unchanged

While this document focuses on the adoption of VMT as a metric for assessing transportation impacts, many other facets of CEQA practice remain unchanged. Transportation impact sections must still discuss other impact categories such as hazards, effects on pedestrians and cyclists, and site circulation concerns. In addition, the Town will continue to have the opportunity to comment on EIRs prepared for consideration by other lead agencies if those EIRs may affect areas in the Town's jurisdiction.

One particular consistency to note is that the option to "tier" CEQA analysis will remain. The tiering process consists of streamlining topics studied for a project if that project was assessed under a previous EIR. A classic example of this is the development of a single parcel that is consistent with a previously analyzed Specific Plan. The project need only analyze those items which were not previously analyzed. This practice will also apply to VMT analysis, provided the EIR from which the project tiers also studied VMT. In the near term, this may result in tiered projects requiring supplemental VMT analysis; however, in the future, projects that are consistent with a cleared General Plan or Specific Plan may not be required to undergo the full VMT analysis process.

## Taking the Next Steps

The immediate next steps for the Town as a lead agency are to provide staff and applicants with guidance pertaining to each of the questions posed above. Fehr & Peers has presented an initial assessment of the Town's options, and has discussed each in greater detail in the body of this document; however, the

decision on how to answer each implementation question must ultimately be made by the Town. The **Summary of Decisions, Options, and Recommendations**, presented as **Appendix A** and in the matrix beginning on the next page, provides an abbreviated overview of this document's contents and corresponding action items and decision points.

It is very important to understand that the implementation of SB 743 is just beginning across the state for many lead agencies. Current CEQA practices have developed over several decades as a result of a large body of case law and periodic updates to the *CEQA Guidelines*. Because SB 743 implementation is brand new, there is not yet any case law to guide our understanding or interpretation. The following represents our current understanding of the issues and options involved, informed by our research into SB 743 and knowledge of past CEQA practice; this understanding will evolve over time as more agencies apply SB 743 concepts to their own CEQA procedures. It is recommended that legal counsel be consulted as part of this SB 743 implementation process.

Summary of SB 743 Decisions, Options, and Recommendations

Lead Agency Decisions	Common Options	Common Limitations	Considerations	Town of Los Gatos Initial Recommendations
<b>What form of VMT metrics could be used?</b>	<div><div>1.</div><div>Total Project Generated VMT</div></div> <div><div>2.</div><div>Total Project Generated VMT per Service Population<sup>3</sup></div></div> <div><div>3.</div><div>Household generated VMT per Resident (requires an activity/tour-based travel forecasting model)</div></div> <div><div>4.</div><div>Home-Based VMT per Resident (a partial VMT estimate)</div></div> <div><div>5.</div><div>Home-Based Work VMT per Employee (a partial VMT estimate)</div></div> <div><div>6.</div><div>Project’s Effect on VMT using Boundary VMT for a specific area</div></div>	Metrics other than total project generated VMT and total project generated VMT per service population typically only represent partial VMT (i.e., some vehicle types and trip purposes are excluded in the models used to estimate VMT). The use of partial VMT may be beneficial for baseline screening of smaller projects, but for larger and more complex projects total VMT may be needed for a complete VMT impact analysis. Project-generated VMT metrics cannot capture how a project changes behavior of non-project residents or employees.	Total VMT metrics include all types of VMT (i.e., visitor trips, medium-duty and heavy-duty vehicles, public transit buses, and other types of vehicle miles that might not be captured in the most common partial VMT metrics) captured by a travel forecasting model, regardless of the type of vehicle or the trip’s purpose. Partial VMT refers to the use of only particular trip purposes and/or vehicle types for assessing a project’s impacts. The expectations of a CEQA impact analysis to strive to provide a complete picture of the effects of a project on the environment are highlighted within the <i>CEQA Guidelines</i> . For lead agencies, VMT metrics and method should consider current practice for air quality, greenhouse gases (GHG), and energy consumption impact analysis. In general, VMT is used as an input for these other analyses and current practice is to produce VMT estimates and forecasts that comply with <i>CEQA Guidelines</i> expectations.	<p><b><u>Option 1: Rely on the OPR <i>Technical Advisory</i> Thresholds</u></b> Include the following so that all forms of VMT needed for project screening and complete VMT analysis are available:</p> <ul style="list-style-type: none"><li>• Total Project Generated VMT</li><li>• Total Project Generated VMT per Service Population</li><li>• Home-Based VMT per Resident</li><li>• Home-Based Work VMT per Employee</li><li>• Boundary VMT for an appropriate area affected by the Project (needed for air quality, GHG, and energy analysis)</li></ul> <p><b><u>Option 2: Set Thresholds Consistent with the General Plan <i>Future Year VMT Projections</i></u></b> Include the following so that forms of VMT needed for a complete VMT analysis are available:</p> <ul style="list-style-type: none"><li>• Total Project Generated VMT</li><li>• Total Project Generated VMT per Service Population</li><li>• Boundary VMT for an appropriate area affected by the Project (needed for air quality, GHG, and energy analysis)</li></ul>
<b>What methods are available to use in estimating and forecasting VMT?</b>	<div><div>1.</div><div>Caltrans Statewide Travel Demand Model</div></div> <div><div>2.</div><div>Metropolitan Transportation Commission (MTC) Regional Travel Forecasting Model</div></div> <div><div>3.</div><div>VTA-C/CAG Bi-County Travel Forecasting Model</div></div> <div><div>4.</div><div>Local Town of Los Gatos Travel Forecasting Model (not currently available)</div></div> <div><div>5.</div><div>Non-model “Accounting Methods” such as sketch planning tool or spreadsheet<sup>4</sup></div></div>	Statewide and regional models have limited sensitivity and accuracy for local scale applications off the shelf. Regional and local models often truncate trips at model boundaries. Sketch and spreadsheet tools do not capture the ‘project effect on VMT’.	Selection of an appropriate travel forecasting approach is an important step because the tool used to develop VMT thresholds must also be used to evaluate a project’s direct and cumulative VMT impacts. Regional or local models should be calibrated and validated for local project-scale sensitivity/accuracy (including appending trip length data for trips with external trip ends) before using these models to analyze both ‘project generated VMT’ and ‘project effect on VMT’.	<p><b><u>Option 1: Rely on the OPR <i>Technical Advisory</i> Thresholds</u></b> Use the Santa Clara Countywide VMT Evaluation Tool for baseline VMT screening, And most likely the VTA-C/CAG Bi-County Travel Forecasting Model, Local Town of Los Gatos Travel Forecasting Model (not currently available), or Non-model “Accounting Methods” such as sketch planning tool or spreadsheet.</p> <p><b><u>Option 2: Set Thresholds Consistent with the General Plan <i>Future Year VMT Projections</i></u></b> Most likely the VTA-C/CAG Bi-County Travel Forecasting Model, Local Town of Los Gatos Travel Forecasting Model (not currently available), or Non-model “Accounting Methods” such as sketch planning tool or spreadsheet.</p>

<sup>3</sup> Service population includes population plus employment and may include students or visitors; it is intended to include all independent variables used in estimating trips.  
<sup>4</sup> Sketch planning tool or spreadsheet method has limitations if using a townwide/citywide or regional average for a threshold.

Summary of SB 743 Decisions, Options, and Recommendations				
Lead Agency Decisions	Common Options	Common Limitations	Considerations	Town of Los Gatos Initial Recommendations
<b>Is use of VMT impact screening desired?</b> <sup>5</sup>	<p>Projects that reduce VMT or are located within transit priority areas (TPAs) should be presumed to have a less than significant impact on VMT. Additional screening options identified in the OPR <i>Technical Advisory</i> for:</p> <ol style="list-style-type: none"><li>Map based screening for residential and office projects</li><li>Local-Serving Retail Projects</li><li>Transportation projects that do not add vehicle capacity</li><li>Projects that would not result in a net increase of VMT</li><li>Affordable housing projects</li><li>Small projects</li></ol>	<p>Screening does not provide information about the actual VMT changes associated with the project.</p>	<p>Screening most appropriate if consistent with applicable general plan and supported by substantial evidence.</p>	<p><b><u>Option 1: Rely on the OPR <i>Technical Advisory</i> Thresholds</u></b></p> <p>Rely on screening if consistent with applicable general plan and supported by substantial evidence demonstrating cumulative VMT is declining. For project-by-project VMT analysis with VMT screening, most projects will likely not screen out, which will require a more complete VMT analysis.</p> <p>Apply screening for the following project types:</p> <ul style="list-style-type: none"><li>Small Developments</li><li>Projects in Low-VMT Areas</li><li>Projects in Proximity to Major Transit Stops</li><li>Affordable Housing</li><li>Local-Serving Retail Projects less than 10,000 square feet</li><li>Transportation Projects that do not add vehicle capacity</li></ul> <p>The Santa Clara Countywide VMT Estimation Tool will be applied for screening as follows:</p> <ul style="list-style-type: none"><li>Low VMT generation map-based screening of residential, office, and industrial land uses, those land uses in combination with each other, and those land uses with or without local serving retail space.</li><li>A transit priority areas (TPAs)/major transit stops and high-quality transit corridor (HQTC) screen.</li></ul> <p><b><u>Option 2: Set Thresholds Consistent with the General Plan Future Year VMT Projections</u></b></p> <p>Screening not used for this approach. Rather than analyzing VMT for each proposed land use project individually, projects consistent with the General Plan could be exempt from further VMT impact analysis since VMT impacts would have been analyzed in the General Plan EIR.</p>
<b>What is the VMT impact significance threshold for land use projects under baseline conditions?</b>	<ol style="list-style-type: none"><li>Lead agency discretion consistent with general plan and expectations for ‘project scale’ VMT reductions not accounted for in general plan EIR and supported by substantial evidence.</li><li>OPR 15% below baseline average a town/city or region (light-duty vehicles only)<sup>6</sup></li><li>CARB 14.3% below baseline (2018) average of jurisdiction (all vehicles)</li></ol>	<p>Difficult for lead agencies to determine what level of VMT change is unacceptable when viewed solely through a transportation lens. Uncertainty of VMT trends contributes to difficulty in setting thresholds. Connecting a VMT reduction expectation to baseline helps to reduce uncertainty associated with future conditions.</p>	<p>Since VMT is already used in air quality, GHG, and energy impact analysis, lead agencies should review thresholds for those sections to help inform new thresholds exclusively for transportation purposes.</p> <p>Lead agencies should carefully consider how they value state goals for VMT/GHG reduction in light of other general plan and community objectives. Translating state goals into VMT thresholds should consider substantial evidence such as <i>California Air Resources Board 2017 Scoping Plan - Identified VMT Reductions and Relationships to State Climate Goals</i>, January 2019, CARB.</p>	<p><b><u>Option 1: Rely on the OPR <i>Technical Advisory</i> Thresholds</u></b></p> <p>Specific VMT thresholds for residential, office (work-related), and retail land uses from the OPR Technical Advisory are summarized below.</p> <ul style="list-style-type: none"><li><u>Residential projects</u>: A proposed project exceeding a level of 15 percent below existing (baseline) VMT per capita may indicate a significant transportation impact. Existing VMT per capita may be measured as regional VMT per capita, a townwide VMT per capita, or as geographic sub-area VMT per capita.</li><li><u>Office projects</u>: A proposed project exceeding a level of 15 percent below existing (baseline) regional VMT per employee may indicate a significant transportation impact.</li></ul>

<sup>5</sup> CEQA Guidelines Section 15064.3 states that projects that would reduce VMT or are located in a TPA should be presumed to have a less than significant impact on VMT. The OPR *Technical Advisory* contains other potential screening options.

<sup>6</sup> The OPR and CARB thresholds do not consider the long-term influence of TNCs, internet shopping, new mobility options, or autonomous vehicles.

Summary of SB 743 Decisions, Options, and Recommendations

Lead Agency Decisions	Common Options	Common Limitations	Considerations	Town of Los Gatos Initial Recommendations
	<div>4. CARB 16.8% below baseline (2018) average of jurisdiction (light-duty vehicles only)</div> <div>5. Pending Caltrans-recommended threshold (net zero VMT)<sup>7</sup></div>		Absent development of a specific VMT threshold, lead agencies may rely on those of other state agencies. The CARB thresholds are supported by substantial evidence related to state air quality and GHG goals, but do not consider recent VMT trends or the potential influence of emerging mobility options such as autonomous vehicles (AVs).	<div><div><div><div>• <u>Retail projects</u>: A net increase in total (boundary) VMT may indicate a significant transportation impact.</div><div>• <u>Mixed-use projects</u>: Lead agencies can evaluate each component of a mixed-use project independently and apply the significance threshold for each project type included (e.g., residential and retail). Alternatively, a lead agency may consider only the project’s dominant use. In the analysis of each use, a project should take credit for internal capture.</div><div>• <u>Other non-residential project types</u>: OPR recommends using the quantified thresholds above, thus a proposed project exceeding a level of 15 percent below existing regional VMT per employee for the proposed non-residential project type or resulting in a net increase in total VMT may be considered significant. Lead agencies, using more location-specific information, may develop their own more specific thresholds, which may include other land use types.</div><div>• <u>Redevelopment projects</u>: Where a project replaces existing VMT-generating land uses, the OPR <i>Technical Advisory</i> recommends that if the replacement leads to a net overall decrease in VMT, the project would lead to a less-than-significant transportation impact. If the project leads to a net overall increase in VMT, then the thresholds described above should apply.</div></div></div><div><div><b>Option 2: Set Thresholds Consistent with the General Plan Future Year VMT Projections</b></div><div>Set baseline VMT threshold based on long-term General Plan expectations for air quality and GHG emissions. The analysis to determine these thresholds would be completed if the Town Council selects this option. Example baseline thresholds are as follows.</div><div><div>• Land Use Projects:<div><div>• Project Impact: A significant impact would occur if the VMT rate for the project would exceed a level of X% below the applicable baseline VMT rate.</div><div>• Project Effect: A significant impact would occur if the project increases total (boundary) regional VMT compared to baseline conditions.</div></div></div><div>• Land Use Plans:<div><div>• Project Impact: A significant impact would occur if the VMT rate for the plan area would exceed a level of X% below the applicable baseline VMT rate.</div></div></div></div></div></div>

<sup>7</sup> Caltrans has released draft Interim Guidance on “*Determining CEQA Significance for GHG Emissions for Projects on the State Highway System*” that recommends that any increase in GHG emissions would constitute a significant impact. This has been referred to as the “Net Zero VMT threshold”. Caltrans has thus far signaled that this threshold would be applied only to transportation projects.

Summary of SB 743 Decisions, Options, and Recommendations

Lead Agency Decisions	Common Options	Common Limitations	Considerations	Town of Los Gatos Initial Recommendations
<b>What is the VMT impact significance threshold for land use projects under cumulative conditions?</b>	<div>1. Use a regional model to analyze the ‘project’s effect on VMT’ based on RTP/SCS consistency [projects should not increase the total regional VMT (either project generated or boundary VMT) forecast used to support the RTP/SCS air quality conformity and SB 375 GHG targets].</div> <div>2. A lead agency can use the project analysis above if based on an efficiency metric form of VMT and evidence exists to demonstrate that cumulative trends in VMT rates are declining.</div> <div>3. Establish a VMT reduction threshold for cumulative conditions consistent with long-term air pollution and GHG reduction expectations.</div>	<div>Uncertainty of VMT trends makes a cumulative impact finding less certain.</div> <div>Ability for a lead agency to identify the project’s effect on land supply and corresponding VMT. Land use projects change land supply and the allocation of future population and employment growth. As such cumulative analysis should maintain the same control totals of regional population and employment growth.</div> <div>Requires knowledge of the forecasting tools available to test the project’s effect on land supply and VMT.</div>	Analyze the project’s effect on land supply and VMT using an appropriate valid model. For impact findings, consider all available substantial evidence including <i>2018 Progress Report, California’s Sustainable Communities and Climate Protection Act</i> , November 2018, CARB and current research on the long-term effects of transportation network companies (TNCs), new mobility options, and autonomous vehicles (AVs). Specific research examples include Fehr & Peers AV effect model testing.	<div><b><u>Option 1: Rely on the OPR <i>Technical Advisory</i> Thresholds</u></b></div> <div>OPR does not present cumulative thresholds. Analyze the project’s effect on land supply and VMT using an appropriately valid travel model. For impact findings, consider all available substantial evidence including <i>California Air Resources Board 2017 Scoping Plan Identified VMT Reductions and Relationships to State Climate Goals</i>, January 2019, and current research on the long-term effects of transportation network companies (TNCs), new mobility options, and autonomous vehicles (AVs). The following are suggested cumulative thresholds.</div> <div><div><div>Land Use Projects:</div><div><div>Project Effect: A significant impact would occur if the project increases total regional VMT compared to cumulative no project conditions.</div></div></div><div><div>Land Use Plans:</div><div><div>Project Effect: A significant impact would occur if growth in the plan area increases total VMT in the study area compared to cumulative no project conditions.</div></div></div><div><div>Transportation Projects: A significant impact would occur if the project causes a net increase in total regional VMT compared to cumulative no project conditions.</div></div></div> <div>All land use and transportation projects: A significant impact would occur if the project is inconsistent with the Regional Transportation Plan/Sustainable Community Strategy Plan (Plan Bay Area).</div> <div><b><u>Option 2: Set Thresholds Consistent with the General Plan Future Year VMT Projections</u></b></div> <div>Use the same cumulative thresholds as Option 1.</div>
<b>What is the VMT impact significant threshold for transportation projects under baseline conditions?</b>	Lead agencies have discretion to choose their own metrics and thresholds for transportation project impact analysis. If VMT is selected, OPR recommends treating projects that reduce, or have no impact on, VMT to be presumed to have a less than significant impact.	<div>Continued use of LOS is uncertain because of CEQA Guidelines Section 15064.3(b)(2) and 15064.7(d)(2).</div> <div>Transit, especially on-demand transit service, can generate new VMT, which should be considered as part of impact conclusions.</div>	Consult CEQA legal advice about whether lead agency discretion allows continued use of LOS and whether VMT is required. VMT is required as an input to air quality, GHG, and energy impact analysis and should include induced vehicle travel effects.	<div><b><u>Option 1: Rely on the OPR <i>Technical Advisory</i> Thresholds</u></b></div> <div><div><div>Baseline Transportation Threshold: A significant impact would occur if a project causes a net increase in total regional VMT compared to baseline conditions or opening year no project conditions.</div></div><div><div>Cumulative Transportation Threshold: A significant impact would occur if the project causes a net increase in total regional VMT compared to cumulative no project conditions.</div></div></div> <div><b><u>Option 2: Set Thresholds Consistent with the General Plan Future Year VMT Projections</u></b></div> <div>Use the same cumulative thresholds as Option 1.</div>

Summary of SB 743 Decisions, Options, and Recommendations				
Lead Agency Decisions	Common Options	Common Limitations	Considerations	Town of Los Gatos Initial Recommendations
What VMT reduction mitigation strategies are feasible?	Menu of built environment and transportation demand management (TDM) mitigation strategies contained in Quantifying Greenhouse Gas Mitigation Strategies, CAPCOA, 2010.	Built environment strategies require modifying the project, which may create inconsistencies with the project description and financial feasibility. TDM strategies are often building tenant dependent so their use requires on-going monitoring and adjusting to account for changes in build tenants and their travel behavior. Ad-hoc project-by-project mitigation is less effective for reducing VMT than larger scale program-based approaches such as an impact fee program.	Develop a VMT mitigation program using any of the following approaches.  1. Impact fee program based on a VMT reduction nexus.  2. In-lieu fee program for VMT reducing actions.  3. VMT mitigation bank or exchange program.  4. TDM ordinance applying to all employers.	<b><u>Option 1: Rely on the OPR Technical Advisory Thresholds</u></b> Lead agencies have the discretion to select mitigation measures and alternatives to reduce VMT. Ad-hoc project-by-project mitigation is less effective for reducing VMT than larger scale program-based approaches such as an impact fee program.  <b><u>Option 2: Set Thresholds Consistent with the General Plan Future Year VMT Projections</u></b> Lead agencies have the discretion to select mitigation measures and alternatives to reduce VMT. Ad-hoc project-by-project mitigation is less effective for reducing VMT than larger scale program-based approaches such as an impact fee program.

# Chapter 1. Introduction

SB 743 implementation will provide guidance on and set policies regarding the evaluation of transportation impacts under the California Environmental Quality Act (CEQA). SB 743 removes the use of automobile delay or traffic congestion for determining transportation impacts in environmental review. Instead, the latest *CEQA Guidelines* now specify that Vehicle Miles Traveled, or VMT<sup>8</sup>, is the appropriate metric to evaluate transportation impacts. To comply with these new rules, the Town will need to define policies and practices regarding the evaluation of transportation impacts under the California Environmental Quality Act, including guidance on how VMT should be calculated and presented in environmental documents. In short, SB 743 changes the focus of transportation impact analysis in CEQA from measuring impacts to drivers, to measuring the impact of driving. For additional information, **Appendix C** and **D** provide a list of frequently asked questions (FAQ) on evaluating transportation impacts in CEQA and a summary sheet on SB 743 and the transition from LOS to VMT, respectively.

## Approach

Under CEQA, agencies must decide what constitutes a significant environmental impact. The *CEQA Guidelines* encourage the use of thresholds of significance; they can be quantitative or qualitative performance standards by which the agency can measure the amount of impact the project causes and thereby determine if the project's impacts are significant. In fact, the new *CEQA Guidelines* Section 15064.3(b)(4) (cited below) establishes that the lead agency has discretion to choose the most appropriate VMT methods for transportation impact analysis.

*Methodology. A lead agency has discretion to choose the most appropriate methodology to evaluate a project's vehicle miles traveled, including whether to express the change in absolute terms, per capita, per household or in any other measure. A lead agency may use models to estimate a project's vehicle miles traveled and may revise those estimates to reflect professional judgment based on substantial evidence. Any assumptions used to estimate vehicle miles traveled and any revisions to model outputs should be documented and explained in the environmental document prepared for the project. The standard of adequacy in Section 15151 shall apply to the analysis described in this section.*

---

<sup>8</sup> VMT refers to "Vehicle Miles Traveled," a metric that accounts for the number of vehicle trips generated plus the length or distance of those trips. VMT is an accessibility performance metric that evaluates the changes in land use patterns, regional transportation systems, and other built environment characteristics, which is different from what the mobility performance metric vehicle level of service measures – vehicle mobility. The document will use the terms Project generated VMT and Project's effect on VMT using boundary VMT metrics for specific geographic areas. Project generated VMT is the sum of the "VMT from" and "VMT to", and within a project site. Project's effect on VMT uses geographic boundary VMT to evaluate the change in VMT on all roadways without and with the project within a specific geographic area.

The expectations for environmental impact analysis highlighted within the *CEQA Guidelines* are listed below.

- § 15003 (f) = fullest possible protection of the environment...
- § 15003 (i) = adequacy, completeness, and good-faith effort at full disclosure...
- § 15125 (c) = EIR must demonstrate that the significant environmental impacts of the proposed project were adequately investigated...
- § 15144 = an agency must use its best efforts to find out and disclose...
- § 15151 = sufficient analysis to allow a decision which intelligently takes account of environmental consequences...

With the *CEQA Guidelines* expectations for an environmental impact analysis in mind, this document discusses several questions, grouped by the specific decisions about VMT metrics, VMT calculation methods, VMT significance thresholds, and VMT mitigation actions.<sup>9</sup> Options and limitations for each question are presented from a technical transportation planning and engineering perspective with a particular emphasis on addressing the *CEQA Guidelines* expectations for an environmental impact analysis.

For simplicity, a Decisions, Options, Considerations, and Recommendations matrix accompanies this document as **Appendix A** and summarizes the questions mentioned above. Town staff will use the document and other supporting materials to develop its VMT significance thresholds.

Because VMT is also used as an input for air quality, GHG, and energy consumption impact analyses in CEQA, the document will also discuss how VMT significance thresholds affect other aspects of the CEQA process.

For each of the questions, there are three separate categories of projects that are subject to CEQA review and for which VMT evaluation will be needed. The Town will need to address how each of these three project categories will be evaluated, and consider all three project types when responding to policy questions:

- **Land Use Projects:** typically development projects on a single parcel or multiple adjacent parcels;
- **Land Use Plans:** such as the current General Plan update and future Specific Plans;
- **Transportation Projects:** infrastructure changes such as building or removing roads, bicycle facilities, and transit facilities.

The implementation of SB 743 is just beginning for many lead agencies. Current CEQA practices have developed over several decades, incorporating a large body of case law and periodic updates to the *CEQA Guidelines*. Because SB 743 implementation is brand new, there is not yet any case law to guide our

---

<sup>9</sup> Typical CEQA practice focuses on environmental effects that occur on a typical weekday, so all references to VMT in this document are intended to mean VMT that occurs on a typical weekday.

understanding or interpretation. The document represents our current understanding of the options, limitations, and considerations, informed by our research into SB 743 and knowledge of past CEQA practice; this understanding will evolve over time as more agencies apply SB 743 concepts to their own CEQA procedures.

## Outline

This document includes a background discussion about SB 743 and then transitions to the five sections: Background, VMT Metrics, VMT Calculation Methods, VMT Significance Thresholds, and VMT Mitigation Actions. The document is outlined below.

- **Chapter 2: Background.** A background discussion of transportation analysis before and after SB 743 implementation to provide context for the decisions in the following sections. This section will also include a summary of relevant local land use and transportation policies planning documents, including the Town's 2020 General Plan, Bicycle and Pedestrian Master Plan, Traffic Impact Policy, and Complete Streets Policy.
- **Chapter 3: VMT Metrics.** As a lead agency, the Town of Los Gatos has the discretion to choose the most appropriate methods to evaluate a project's VMT, including how the results of that method are expressed. Generally, VMT is expressed in several ways: total project generated VMT, project generated rates [Total project generated VMT per service population or partial project generated VMT per resident (or per employee)], in total (all VMT associated with a project or plan), or as the net "effect" a project will have on VMT (listed as project's effect on VMT). This section will describe the benefits and shortcomings of each metric.
  - What form of VMT metrics could be used?<sup>10</sup>
- **Chapter 4: VMT Calculation Methods.** VMT forecasts are generated using various forms of models that range from simple spreadsheets (off-model) based on historic traffic growth trends to complex computer models that account for numerous factors that influence travel demand. In some cases, VMT can be estimated using sketch models or spreadsheet tools. VMT can also be estimated directly by multiplying the number of trips by an average trip length. Given the availability of two travel forecasting modes, the document will provide the Town with a review of Metropolitan Transportation Commission (MTC) and the Santa Clara County Valley Transportation Authority (VTA) travel forecasting models for VMT calculations in the Town of Los Gatos, including analytical strengths and weaknesses of each option.
  - What methods are available to use in estimating and forecasting VMT?
- **Chapter 5: VMT Impact Significance Thresholds.** The Town has discretion to choose its threshold of significance for identifying a VMT impact. The intent of a VMT threshold is to identify whether a project has substantial environmental impacts due to traffic (such as noise, air, pollution, and safety concerns), and whether a project balances the needs of congestion

---

<sup>10</sup> Each VMT metric will be defined in the document.

management with statewide goals such as the promotion of infill development. This chapter will also discuss the opportunity for “screening” projects in low VMT or transit priority areas. Should the Town choose not to use screening or need to conduct a complete VMT analysis baseline and cumulative VMT thresholds will be needed; therefore, this chapter will describe possible thresholds and summarize the supporting evidence for each.

- Is the use of VMT impact screening desired?
- What is the VMT impact significance threshold for land use projects under baseline conditions?
- What is the VMT impact significance threshold for land use projects under cumulative conditions?
- What is the VMT impact significant threshold for transportation projects under baseline conditions?
- **Chapter 6: VMT Mitigation Actions.** The Town will also need to determine if projects will be able to mitigate significant VMT impacts, and whether those measures can reduce the severity of a potential VMT impact. This chapter will include a review of how other jurisdictions have incorporated transportation demand management into their VMT mitigation measures for VMT impacts, and a discussion of the potential risks and uncertainties related to VMT mitigation measures. This document will also discuss program-based VMT mitigation approaches which may be more effective than project-site only strategies and provide a way for development contributions to be pooled to pay for VMT reduction strategies that would not be feasible for individual projects to implement.
  - What VMT reduction mitigation strategies are feasible?
- **Chapter 7: Additional Implementation Considerations.** This final chapter discusses a few Town-specific implementation considerations.
- **Appendices.** The appendices include background data and additional information associated with the information presented in this document.
  - Appendix A: Summary Matrix of Decisions, Options, and Recommendations
  - Appendix B: Comparison of Available Travel Forecasting Models
  - Appendix C: Frequently Asked Questions (FAQ): Evaluating Transportation Impacts in CEQA
  - Appendix D: Summary Sheet: SB 743 and the Transition from LOS to VMT
  - Appendix E: Summary of Legal Framework of SB 743 and Technical Background Information
  - Appendix F: Additional VMT Thresholds Background and Options Discussion
  - Appendix G: List of Transportation Projects Exempt from Environmental Analysis (CEQA)
  - Appendix H: Small Project Screening for SB 743
  - Appendix I: VMT Characteristics of the Town of Los Gatos
  - Appendix J: VMT Mitigation Through Banks and Exchanges: Understanding New Mitigation Approaches

- Appendix K: Comparison of CAPCOA Strategies Versus New Research Since 2010

# Chapter 2. Background

## Use of CEQA Prior to SB 743

CEQA was enacted in 1970 with the goal of providing a mechanism for disclosing to the public the environmental impacts of proposed actions. Before taking a discretionary action, lead agencies (such as the Town of Los Gatos) must determine if that action is subject to CEQA and conduct a review of the effects of that action on the physical environment. The State Office of Planning and Research (OPR) prepares and maintains guidelines to help agencies implement CEQA.

Under CEQA, lead agencies must determine whether a proposed project has the potential to cause significant environmental impacts. This determination must be based, to the extent possible, on factual data and scientific methods of analysis. The project's effect on transportation is one of the areas that must be analyzed. For many years, the Town of Los Gatos has used vehicle Level of Service (LOS) as the primary measure to evaluate a project's effect and determine transportation impacts.

LOS is a qualitative description of vehicular traffic flow based on factors such as speed, travel time, delay, and freedom to maneuver. Six levels are defined from LOS A, which reflects free-flow conditions where there is very little interaction between vehicles, to LOS F, where vehicle demand exceeds capacity and high levels of vehicle delay result. LOS E represents "at-capacity" operations. When traffic volumes exceed the capacity at an intersection, vehicles may wait through multiple signal cycles before traveling through the intersection; these operations are designated as LOS F. The calculation of vehicle LOS is done through the application of specialized software and is based on traffic counts, observations of vehicle interactions, and data about traffic signal operations (at those intersections that are signalized).

Mitigating a LOS impact typically involves making changes to the physical transportation system in order to accommodate additional vehicles and reduce delays. These mitigations may involve actions such as installing traffic signals, adding turn lanes, widening roads, or contributing to the construction of HOV/Express Lanes, among other options. The identification of necessary mitigations resulting from project impacts has historically led to project sponsors identifying and funding these changes to the transportation system (i.e., paying a "fair share" contribution toward funding a new traffic signal or widening an existing roadway).

## Overview of SB 743 and Legal Framework

On September 27, 2013, Governor Jerry Brown signed SB 743 into law and started a process intended to fundamentally change transportation impact analysis as part of CEQA compliance. Specifically, the legislation directed the State of California's OPR to look at different metrics for identifying transportation impacts and make corresponding revisions to the *CEQA Guidelines*. The initial bill includes two legislative intent statements (emphasis and bullets added):

- **New methodologies** under the California Environmental Quality Act are **needed for evaluating transportation impacts** that are better able to promote the state's goals of reducing GHG emissions and traffic-related air pollution, promoting the development of a multimodal transportation system, and providing clean, efficient access to destinations.
- More appropriately balance the needs of congestion management with statewide goals related to **infill development**, promotion of public health through **active transportation**, and **reduction of GHG emissions**.

These statements are important because they provide direction to OPR and to lead agencies. For OPR, the direction is largely about what new metrics should achieve. For lead agencies, the direction is about expected changes in transportation analysis (and related technical areas) and what factors to consider for significance thresholds.

To implement this intent, SB 743 contains amendments to current congestion management law that allow towns, cities, and counties to opt-out of the LOS standards that would otherwise apply. SB 743 does not prevent a lead agency from continuing to analyze delay or LOS as part of other plans (e.g., the general plan), fee programs, or on-going network monitoring. However, these metrics will no longer constitute the basis for CEQA impacts. Lead agencies can still use vehicle LOS outside of the CEQA process if they determine it is an important part of their transportation analysis process. The most common applications will likely occur for jurisdictions wanting to use vehicle LOS to plan roadways in their General Plan or determine nexus relationships for their impact fee programs. Jurisdictions can also continue to condition projects to build transportation improvements through the entitlement process in a variety of ways.

Following several years of draft proposals and related public comments, OPR settled upon VMT as the preferred metric for assessing passenger vehicle-related impacts and issued revised *CEQA Guidelines* in December 2018, along with a *Technical Advisory: On Evaluating Transportation Impacts in CEQA* (December 2018) to assist practitioners in implementing the *CEQA Guidelines* revisions. Under the revised *CEQA Guidelines*, vehicle level of service (LOS) is no longer to be used as a determinant of significant environmental impacts, and analysis of a project's impacts will now be based on assessment of VMT. Lead agencies have until July 2020 to implement the new VMT methods, after which all transportation analysis performed under CEQA must be consistent with the revised *CEQA Guidelines*.

The OPR *Technical Advisory* guidance is not a recipe for SB 743 implementation. Lead agencies must still make their own specific decisions about metrics, methods, thresholds, and mitigation. Further, the OPR guidance is primarily tied to statewide goals for GHG reduction, and does not attempt to balance or resolve potential conflicts between state and lead agency goals, such as those expressed in local agency general plans and/or climate action plans. The OPR *Technical Advisory* presents a 15% statewide average reduction from baseline conditions, which may differ from a local jurisdiction's VMT threshold based on long-term expectations for air quality and GHG expectations stated in its General Plan, Climate Action Plan and/or other long-range plans.

The *CEQA Guidelines* and the associated *OPR Technical Advisory* are largely consistent with the legislative direction noted above. Specifically, the use of VMT as a metric focuses on the total *amount* of driving, rather than the driving *experience*. This new view presents an impact filter intended to promote the reduction of GHG emissions, the development of multimodal transportation networks, and a diversity of land uses. VMT can help identify how projects (land development and infrastructure) influence accessibility (i.e., access to places and people), noise, and emissions; thus, its selection as a metric is aligned with the objectives of SB 743.

While final implementation steps for SB 743 have not yet been completed by most lead agencies, enough information is available to inform lead agencies about how to prepare for the upcoming transition to VMT. Based on the background context outlined above (see **Appendix E** for more information), the remainder of this document provides information about key decisions the Town will need to make regarding VMT metrics, calculation methods, impact thresholds, and impact mitigation.

## State of SB 743 Implementation

The California lead agencies that have adopted VMT thresholds as of approximately January 2020 include:

- City/County of San Francisco
- City of Oakland
- City of Elk Grove
- City of Los Angeles
- City of San Jose
- City of Woodland
- CSU System: All 23 Campuses
- San Bernardino County

Most early adopters were larger jurisdictions such as the City/County of San Francisco, City of Oakland, City of Los Angeles, and City of San Jose. These jurisdictions implemented screening thresholds by partial VMT or total VMT. Of these jurisdictions, only the City/County of San Francisco chose not to maintain LOS as an analysis requirement. Some of the more suburban communities have chosen to set thresholds based on total VMT. As will be discussed in the following chapters there are many possible VMT thresholds, but two prevailing threshold options are most prevalent: 1) a project-by-project baseline conditions VMT screening by land use (similar to or identical to the *OPR Technical Advisory*), or 2) set a jurisdiction specific VMT threshold based on long-term expectations for air quality and GHG expectations (as discussed later, a jurisdiction may choose to complete VMT impact analysis as part of its General Plan EIR and make specific use of *CEQA Guidelines* Section 15183 to streamline project specific CEQA analysis).

## Local Framework and Summary of Existing Policies

The Town's General Plan includes underlying expectations of how population and employment will change between the base year and future year scenarios. Because VMT is a composite metric that is an output of combining long-term population and employment growth projections with long-term transportation network infrastructure – the Town of Los Gatos effectively already has a VMT growth budget (i.e., how much VMT growth is anticipated, where that growth will occur and in what forms) that has already been planned for and determined to be acceptable in the *Los Gatos 2020 General Plan*. The Town is currently updating their General Plan, which may change current goals, policies, and programs to address emerging trends, recent changes in State law and consider new issues in Los Gatos. The *Town of Los Gatos Bicycle and Pedestrian Master Plan* (2017) describes the planned bicycle and pedestrian networks. The *Los Gatos Sustainability Plan* (2012) quantifies the communitywide GHG emissions between 2008 and 2020 and sets a communitywide GHG emissions target with specific measures to further reduce GHG emissions. The *Town of Los Gatos Traffic Impact Policy* establishes the framework to ensure that trips generated by new developments do not create undesirable effects and guarantee that each new development pays for its fair share of the transportation improvements needed to accommodate the cumulative traffic impacts. The *Town of Los Gatos Complete Streets Policy* defines complete streets principles within the context of Los Gatos, provides the implementation framework on applying the policy, and identifies the process for exemptions.

This section will also include a discussion of the specification of the Santa Clara Countywide VMT Estimation Tool that will screen and estimate project generated VMT and VMT reductions for land use projects in Santa Clara County, the Town's standard conditions of approval, and the VTA *Transportation Impact Analysis Guidelines* (2014).

### General Plan

The Land Use and Community Design Element, Vasona Light Rail Element, and Transportation Element of the *Los Gatos 2020 General Plan* (2010) states the community land use and transportation goals, policies, and actions for land use growth and multimodal travel. The Transportation Element and Vasona Light Rail Element goals are listed below for reference:

- Goal TRA-1: To develop transportation systems that meet current and future needs of residents and businesses.
- Goal TRA-2: To create and maintain a safe, efficient, and well-designed roadway network.
- Goal TRA-3: To prevent and mitigate traffic impacts from new development.
- Goal TRA-4: To ensure that future changes to Highway 17 do not negatively impact the quality of life or small-town character of Los Gatos.
- Goal TRA-5: To ensure that Los Gatos's streets are safe for all users, including drivers, cyclists, and pedestrians.
- Goal TRA-6: To improve traffic flow in the downtown and reduce the effect of downtown traffic on nearby commercial and residential areas.

- Goal TRA-7: To ensure that hillside streets maintain the rural atmosphere, minimize disruption of ecological integrity, and provide safe and continuous access consistent with development allowed by the Hillside Specific Plan and Hillside Development Standards and Guidelines.
- Goal TRA-8: To improve mass transit within Los Gatos.
- Goal TRA-9: To reduce reliance on the automobile by promoting alternative modes of transportation in the transportation system.
- Goal TRA-10: To encourage increased levels of bicycling and walking.
- Goal TRA-11: To provide a safe and efficient system of bicycle and multiple use trails throughout the Town, creating a non-motorized connection to recreational and commuting destinations.
- Goal TRA-12: To ensure a well-designed and well-maintained system of trails that connects the Town and open space areas.
- Goal TRA-13: To provide adequate parking for existing and proposed uses, and to minimize impacts on surrounding residential neighborhoods.
- Goal TRA-14: To ensure that there is adequate parking in Downtown to meet the needs of Los Gatos residents and visitors.
- Goal VLR-1: To promote the construction of Vasona Light Rail.
- Goal VLR-2: To encourage affordable housing (senior housing, multi-family housing, mixed-use with housing) in appropriate locations within the Vasona Light Rail area to address the Town's housing needs and take advantage of the opportunities afforded by mass transit.
- Goal VLR-3: To encourage mixed-use developments that coordinate housing in proximity to either neighborhood commercial uses or employment centers.
- Goal VLR-4: To provide opportunities for a variety of nonresidential land uses within the Vasona Light Rail area.
- Goal VLR-5: To provide opportunities for the Vasona Light Rail area to address the recreational and open space needs of the Town.
- Goal VLR-6: To work with property owners and prospective developers to facilitate orderly development.
- Goal VLR-7: To ensure that the design review process produces a high quality mixture of residential and non-residential uses within the Vasona Light Rail area.
- Goal VLR-8: To limit the adverse impacts of development within the Vasona Light Rail area.
- Goal VLR-9: To reduce traffic impacts of residential development within the Vasona Light Rail area by taking advantage of mass transit opportunities.

The General Plan policies and actions provide additional detail regarding the underlying expectations of how population and employment will be supported and how the community will travel. Additionally, the General Plan establishes peak hour LOS D<sup>11</sup> as an acceptable level of traffic operation at intersections in

---

<sup>11</sup> Policy TRA-3.5: If project traffic will cause any intersection to drop more than one level if the intersection is at LOS A, B, or C, or to drop at all if the intersection is at LOS D or below, the project shall mitigate the traffic so that the level of service will remain at an acceptable level

Los Gatos; however, the General Plan does not include VMT metrics. The influence of the goals and policies can be strengthened by adding VMT metrics and thresholds to CEQA analysis for land use and transportation projects. The key challenge is determining the appropriate threshold for determining significant impacts that require mitigation. To that end, the Town will need to determine specific VMT metrics and thresholds to be used for the General Plan as well as subsequent land use projects. Addressing VMT impacts in the General Plan Environmental Impact Review (EIR) provides some potential benefits for streamlining land use project CEQA review. The Town can also decide whether to use VMT for transportation projects.

## Sustainability Plan

Over the past ten years, the state of California has adopted state legislation to address climate change and streamline CEQA evaluation of transportation (including AB 32, SB 375, SB 743, and AB 1358). Specifically, with the passage of Assembly Bill (AB) 32, the Global Warming Solutions Act of 2006, the State of California committed itself to reducing GHG emissions to 1990 levels by 2020. SB 375 provides guidance on how curbing emissions from cars and light trucks can help the state comply with AB 32. In response to this state legislation and its community values to reduce GHG emissions, the *Los Gatos Sustainability Plan* (2012) quantifies the communitywide GHG emissions between 2008 and 2020 and sets a communitywide GHG emissions target<sup>12</sup> with specific measures to further reduce GHG emissions. The transportation sector represents the largest communitywide GHG emissions sector (65%). The transportation measures are summarized below:

- Measure TR-1: Support for Pedestrians, Bicyclists, and Transit – Promote walking, bicycling, and transit through new building and new project requirements, a Safe Routes to School Program, traffic calming to dissuade Highway 17 cut-through traffic, and transit access improvements.
- Measure TR-2: North Forty Area Land Uses – Require a variety of local-serving commercial uses and encourage mixed-use development in the North Forty area, reducing VMT.
- Measure TR-3: Fixed-Route Shuttle – Provide a fixed-route shuttle system to the downtown area from key residential areas, employment and commercial centers, Vasona Light Rail, and Vasona Park.
- Measure TR-4: Bicycle Facilities and Programs – Provide for new bicycle facilities and programs through installing new bicycle facilities, requiring bicycle support facilities in major on-residential developments, installing bicycle parking facilities in Downtown, and encouraging a bicycle-sharing program.
- Measure TR-5: School Pool Program – Implement a School Pool Program that helps match parents to carpool students to school.
- Measure TR-6: Vehicle Circulation, Parking, and Idling Reduction Program – Support trip reduction and the use of electric vehicles through a voluntary Employer Commute Reduction

---

<sup>12</sup> Los Gatos Greenhouse Gas Emissions Reduction Target: reduce GHG emissions by 15 percent below baseline (2008 or earlier) emissions by 2020 (Los Gatos Sustainability Plan, page 4-1).

Program, preferential parking for vanpools, carpools, and electric vehicles, and a car-sharing program.

- Measure TR-7: Student Transit Outreach – Coordinate with local school districts on marketing, promoting, and educating students about the benefits of using public transit as a mode of travel.
- Measure TR-8: Vehicle Circulation, Parking, and Idling Reduction Programs – Reduce vehicle circulation associated with parking and reduce vehicle idling through better wayfinding and public outreach around schools during pick-up and drop-off times.

## **Bicycle and Pedestrian Master Plan**

The *Town of Los Gatos Bicycle and Pedestrian Master Plan* (2017) summarizes goals for improving the bicycle and pedestrian network, existing and proposed facilities, and programs involving education, enforcement, and promotion. The Plan was developed in conformance with the *Los Gatos General Plan*, and supports the implementation of a convenient, safe, and accessible system that supports walking and bicycling. Goals of the Bicycle and Pedestrian Master Plan are:

- Goal A. Education and Encouragement: Encourage the Los Gatos and Monte Sereno communities to walk or ride a bike for recreation, transportation, and health, supporting safety education programs for all road users.
- Goal B. Enforcement: Promote safety for all road users through compliance with traffic codes for drivers, bicyclists and pedestrians.
- Goal C. Accessibility and Connectivity: Develop a cohesive and “low-stress” bicycle and pedestrian network that ensures safe and convenient facilities for those bicycling and walking – connecting community members to employment, educational, cultural, civic, transit, recreational and shopping destinations.
- Goal D. Engineering/Development Standards: Provide high-quality and highly effective bicycle and pedestrian facilities to enhance the safety, comfort and convenience of people walking and bicycling.
- Goal E. Evaluation and Implementation Strategies: Ensure successful implementation of the Bicycle and Pedestrian Master Plan by developing effective implementation programs and funding strategies, and establishing clear roles and responsibilities for all relevant Town departments.

## **Traffic Impact Policy**

The *Town of Los Gatos Traffic Impact Policy* (#1-05, March 2017) provides guidance to Town Staff and the development community in implementing the provisions of the Town Municipal Code, Chapter 15, Article VII, Traffic, also known as the “Town of Los Gatos Traffic Impact Mitigation Fee Ordinance.” The Policy is used by the Town to ensure that trips generated by new developments do not create undesirable effects and guarantee that each new development pays for its fair share of the transportation improvements needed to accommodate the cumulative traffic impacts.

Section II of the policy identifies when a traffic impact mitigation fee must be paid and identifies when a comprehensive traffic impact analysis must be conducted. According to the policy, projects that are determined by the Town to generate one or more new net average daily vehicle trips would be required to pay a traffic impact mitigation fee. The fee, currently set at \$902.00 per new net average daily vehicle trip generated (July 1, 2016), is based on the unfunded cost of the transportation improvements necessary to update the traffic circulation system as identified in the *Los Gatos General Plan*. In addition, projects which will generate 20 or more new peak hour vehicle trips would be required to complete a comprehensive traffic impact analysis report.

### Complete Streets Policy

The *Town of Los Gatos Complete Streets Policy* (#3-01, February 2019) guides relevant departments by formally applying complete streets principles in transportation projects and funding programs Town-wide. Complete streets are generally defined as streets that are planned, designed, and operated for safe mobility of all users including pedestrians, bicyclists, motorists, and transit users of all ages and abilities. The policy defines complete streets principles within the context of Los Gatos, provides the implementation framework on applying the policy, and identifies the process for exemptions.

### Santa Clara Countywide VMT Estimation Tool

The Santa Clara Countywide VMT Estimation Tool (SCC VMT Estimation Tool), released May 2020, will screen projects to identify if the projects are exempt from further VMT analysis using Project generated VMT thresholds and transportation priority areas, estimate the Project generated VMT rate and estimate VMT reductions for land use projects in Santa Clara County. The types of land use projects addressed include residential, office, and industrial land uses, those land uses in combination with each other, and those land uses with or without local serving retail space. The SCC VMT Estimation Tool will be modular such that VTA, along with cities in Santa Clara County and the County of Santa Clara, can include their specific VMT screening criteria or model data within the Tool. The Tool will be scalable such that it can be used for a range of project sizes and location within any jurisdiction in Santa Clara County.

The SCC VMT Estimation tool evaluates the VMT for proposed land use projects by determining whether the project is located within a low VMT generating area, estimating the project generated VMT, and evaluating the project generated VMT after potential reduction measures have been applied. The travel forecasting data that the SCC VMT Estimation Tool uses is static, meaning that any data in this tool does not affect the data used from the source travel forecasting model.

The SCC VMT Estimation Tool consists of three separate modules:

- **VMT Screening:** The location of the project is used to determine if the project site is within a low VMT generating area, including low VMT generating traffic analysis zones (TAZ) or parcels and transit priority areas (TPA).
- **Project Generated VMT:** A combination of the project's location and project details is used to estimate VMT generated from the project, which is expressed as a VMT rate (i.e., VMT per

population generating the VMT). This process can use the Santa Clara Valley Transportation Authority (VTA)'s parcel-level VMT data or TAZ level VMT generation rates to estimate the project's VMT.

- **VMT Reductions:** A series of VMT mitigation measures are applied to potentially reduce the project generated VMT. The project VMT is compared to the applicable VMT threshold to determine whether it falls below the threshold at the start, or whether it is reduced below the threshold after applying additional VMT reduction measures. The VMT threshold used in this module is calculated in the VMT Screening module.

### VTA Transportation Impact Analysis Guidelines

The Town of Los Gatos follows the *Santa Clara Valley Transportation Authority (VTA) Congestion Management Program Transportation Impact Analysis Guidelines* (2014) when conducting a transportation impact analysis for a land use or transportation project that affects congestion management program intersections or freeway segments. For consistency, Town staff has also used these guidelines for its local intersection analysis. The VTA Guidelines are established to provide a clear and consistent technical approach for projects that could have transportation effects (adverse and beneficial) on the transportation system and services. TAs provide essential information for decision-makers and the public when evaluating individual development and transportation infrastructure projects.<sup>13</sup>

---

<sup>13</sup> Once Town Council has made its decisions regarding the VMT Metrics, VMT Methods, VMT Thresholds, and VMT Mitigation Approach, Town of Los Gatos Transportation Analysis (TA) guidelines will be prepared to provide a clear and consistent technical approach to transportation improvement and operations analysis within the Town of Los Gatos.

## Chapter 3. VMT Metrics

The *CEQA Guidelines* state that each lead agency can identify the metrics and methods used to evaluate environmental effects, so the Town can choose from a variety of VMT metrics. Typical CEQA practice focuses on environmental effects that occur on a typical weekday, so all references to VMT in the remainder of this document are intended to mean VMT that occurs on a typical weekday. Weekday VMT can be broken down into components related to trips for specific purposes (for example, commute trips or shopping trips). Total VMT will tend to scale with the level of activity in a location; that is, the more people who live or work in a particular zone, the higher the total VMT associated with that zone.

Many jurisdictions find it useful to express VMT as an efficiency metric (e.g., VMT per person or VMT per employee). This form of the metric is unrelated to the level of activity in a particular location and more about how efficiently the people at that location travel. A project that contributes to a more efficient use of the transportation system would reduce the total VMT per person as compared to a no-project scenario. A commonly used efficiency metric is “total VMT per service population,” in which the denominator called “service population” includes all the variables that generate vehicle trips in the models that estimate VMT; in most instances this will include residents plus employees, and may also include other categories of people such as visitors or students if those categories are used in the trip generation estimates in the model.

### Recommendations in OPR Technical Advisory

The OPR *Technical Advisory* recommends the use of efficiency metrics for presentation in CEQA analysis, particularly the following:

- Residential Land Use: Home-based (light-duty vehicle) VMT per capita (resident), or household generated VMT per capita (resident).
- Office Land Use: Home-based work (light-duty vehicle) VMT per employee, total employee VMT per employee, or work tour VMT per employee.

OPR recommends a Total VMT metric for retail uses, particularly the following:

- Retail Land Use: Total VMT (all vehicles) within an area affected by a project.

As the OPR examples show, the VMT metric specification can include all or a portion of all trip purposes, populations, and vehicle types. The OPR recommendations illustrate two VMT metric option concepts:

1. Total VMT (used in the OPR metric for the retail land use) as compared to Partial VMT (used in the OPR metrics for office and residential land uses).
2. Project-Generated VMT (used in the OPR metrics for office and residential land uses) as compared to Project’s Effect on VMT (used in the OPR metric for the retail land use).

## What Form of VMT Metrics Could be Used?

VMT can be expressed in a variety of forms depending on specific objectives of the analysis. Examples of these forms include:

- Total Project Generated VMT: VMT including all vehicle trips, vehicle types, and trip purposes. This can be expressed as Total Project Generated VMT or Total Project Generated VMT per service population (residents plus employees).
- Partial Home-Based VMT: VMT generated by light-duty vehicles for all trips that begin or end at a residential land use. This is used in describing the VMT effects of residential land uses and is often expressed as home-based VMT per resident.
- Partial Home-Based Work VMT: VMT generated by light-duty vehicles only for commute trips (that is, trips that have one end at a workplace and one end at a residence). This is used in describing the VMT effects of workplaces, and is often expressed as home-based work VMT per employee.
- Boundary VMT: VMT that occurs within a selected geographic boundary (e.g., city, county, or region) by any type of vehicle. This captures all on-road travel occurring on a roadway network for any purpose, and includes local trips as well as trips that pass through the area without stopping.

### VMT Metric Options: Total VMT and Partial VMT

**Total VMT** metrics include all types of VMT captured by a travel forecasting model, regardless of the type of vehicle or the trip's purpose. In practice, this means the metric includes visitor trips, medium-duty and heavy-duty vehicles, public transit buses, and other types of vehicle miles that might not be captured in the most common partial VMT metrics.

To the extent that SB 743 is designed to promote infill development, and there is substantial evidence that building projects in one area will have similar VMT effects to existing conditions in that area, a total VMT analysis may not be necessary, or total VMT may be estimated using simpler approaches than a unique travel demand forecasting model run (methodology options are discussed in Chapter 4). However, for projects that are large, complex, controversial, or represent a unique land use for the study area, a total VMT metric will likely be the most appropriate way to assess project effects. In addition, total VMT metrics derived from a transportation forecasting model are necessary to measure a project's *effect* on VMT, or how the project changes the total VMT in a given geographic area. This Boundary VMT is discussed further in a later section "Project's Effect on VMT" (starting on page 22).

Total VMT is also useful for consistency with other EIR sections, namely GHG, air quality, and energy consumption. Each of these sections uses total VMT as an input for its analysis, although they may consider VMT on an annual rather than daily basis.

**Partial VMT** refers to the use of only particular trip purposes and/or vehicle types for assessing a project's impacts. The efficiency metrics recommended by OPR for use in analyzing office and residential projects are partial VMT metrics, because they include only light-duty passenger vehicles, and only trips for a

specific purpose or made by a specific population. The benefit of these partial VMT metrics is that they allow for sketch-level analysis using findings from a prior model run, they are easier to understand and visualize, and for single land uses that are similar to existing development patterns they are likely reflective of the same impact patterns as would be present with analysis of total VMT. Understanding where built environment conditions lead to VMT-efficient residential and workplace activity is substantial evidence that could help support conclusions that adding similar land uses to those areas would create similar outcomes. This can be considered analogous to collecting vehicle counts at a nearby existing project and developing custom local rates. Reporting a portion of VMT from select trip purposes and limiting the VMT to light-duty vehicles could be useful for initial baseline VMT screening, and for some project types, a more complete VMT analysis may be needed.

Project applicants may also have concerns with the separation of land uses because it may produce VMT forecasts that dilute the benefits of their projects. For example, mixed-use projects help reduce VMT by shortening vehicle trip lengths or reducing vehicle trips because of the convenience of walking, bicycling, or using transit between project destinations. To quantify these effects with models used in current practice requires analyzing the project as a whole.

### **VMT Metric Options: Project Generated VMT and Project's Effect on VMT**

There are several different VMT metrics that must be included in a complete VMT analysis. One of them, "project's effect on VMT," requires use of a travel forecasting model to evaluate potential areawide VMT changes caused by the project.

- Project-generated VMT: The sum of the VMT from, to, and within a project site.
- Project's effect on VMT (within a selected geographic boundary): An evaluation of the change in total on-road vehicle travel within a geographic area boundary between without and with project conditions.<sup>14</sup> The boundary for a project's analysis should be selected based on project characteristics such as size and location. The analysis would typically be done at a townwide/citywide, countywide, or regional scale.

The project-generated VMT and project's effect on VMT (using boundary VMT) accounting methods are presented in **Figure 1** as a generic representation of the VMT metrics. **Figure 2** shows the same metrics based on the Town of Los Gatos town limits and street system. Both of these metrics are needed for a comprehensive view of a project's VMT effects. As discussed in the OPR *Technical Advisory*, "...new retail development redistributes shopping trips rather than creating new trips,<sup>15</sup> estimating the total change in

---

<sup>14</sup> An often-cited example of how a project can affect VMT is the addition of a grocery store in a food desert. Residents of a neighborhood without a grocery store have to travel a great distance to an existing grocery store. Adding the grocery store to that neighborhood will shorten many of the grocery shopping trips and reduce the VMT to/from the neighborhood.

<sup>15</sup> Lovejoy, et al. (2013) *Measuring the impacts of local land-use policies on vehicle miles traveled: The case of the first big-box store in Davis, California*, The Journal of Transport and Land Use.

VMT (i.e., the difference in total VMT in the area affected with and without the project) is the best way to analyze a retail project's transportation impact."

## Project Generated VMT

Notes: External to External (XX) trips are excluded from this VMT metric.  
Adjustments to project generated VMT made to include the full length of trips that leave the jurisdiction to capture inter-jurisdiction travel.

## Project Effect on VMT (Boundary VMT)

Notes: Boundary VMT is all the VMT on the streets within the Project Limits / Jurisdiction Limits.

Figure 1  
Measuring Vehicle Miles Traveled (VMT)

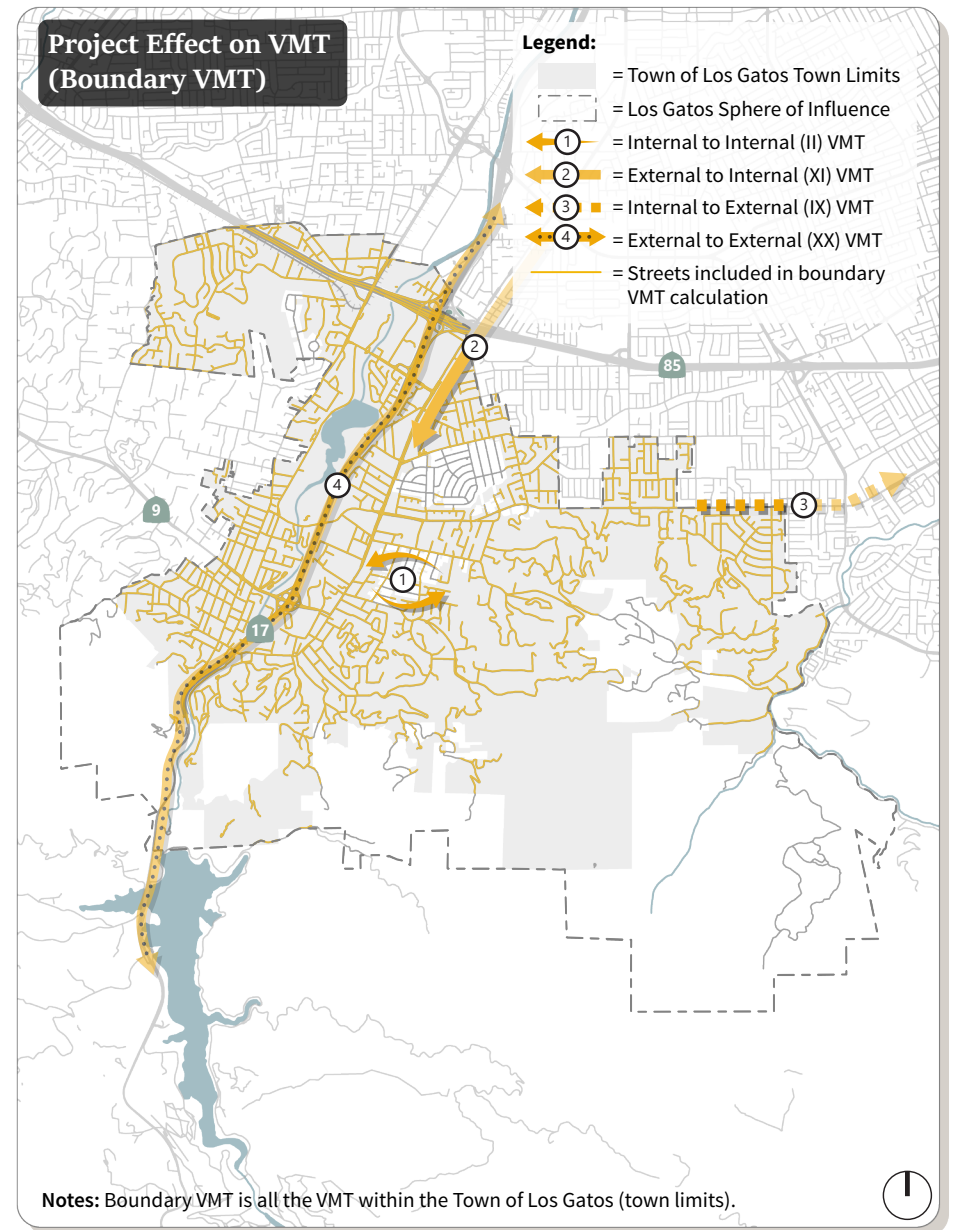

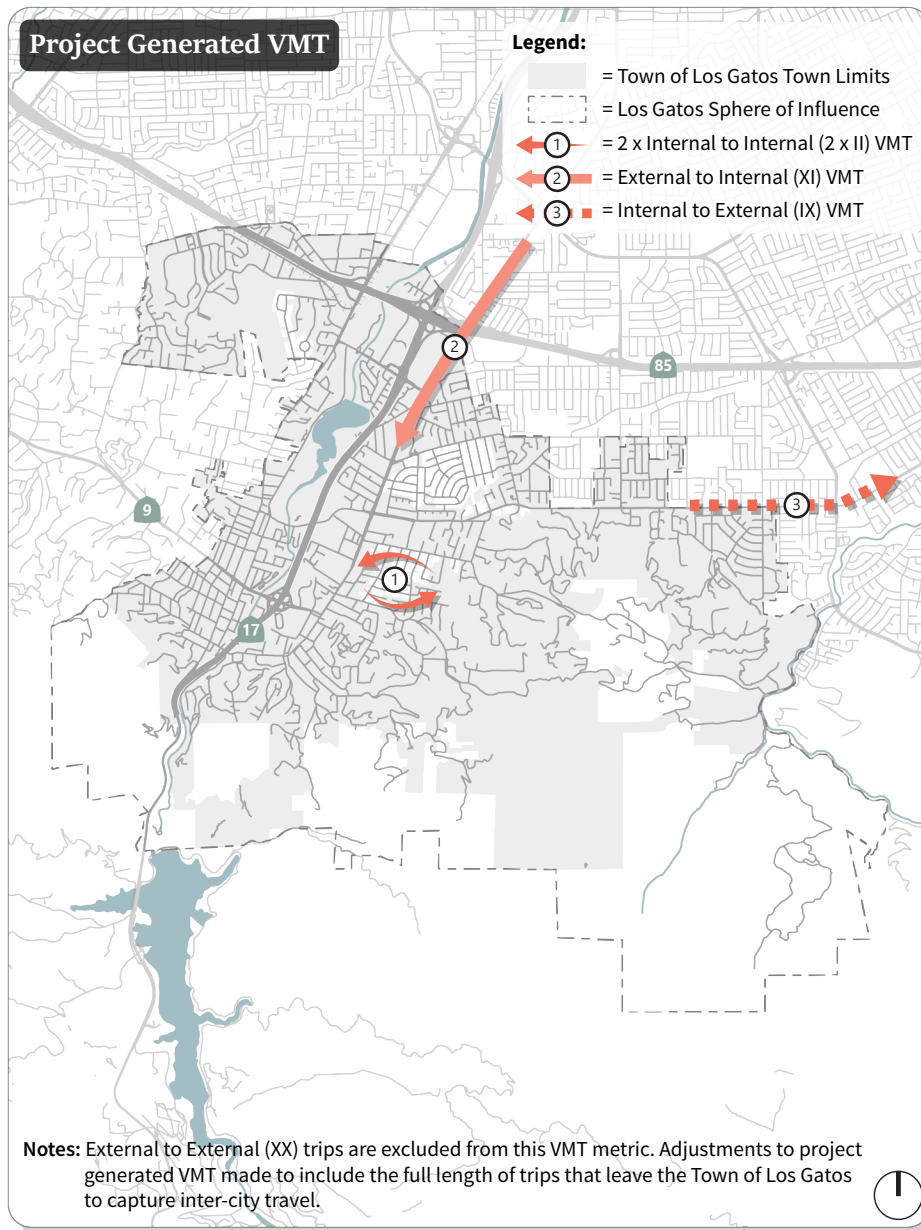

Figure 2  
Town of Los Gatos  
Measuring Vehicle Miles Traveled (VMT)

**Project-generated VMT** is calculated by summing the “VMT from” and “VMT to” the project site (or a larger area when the project is a plan such as a Specific Plan or General Plan). These calculations are usually performed using outputs from a travel forecasting model. Most travel forecasting models will output information on the Project Generated VMT associated with the land use in a given transportation analysis zone (TAZ); that total is typically as follows:

$$\text{Project Generated VMT} = \text{VMT From} + \text{VMT To} = (II + IX) + (II + XI) = 2 * II + IX + XI$$

- Internal-internal (II): The full length of all trips made entirely within the project area is counted.
- Internal-external (IX): The full length of all trips with an origin within the project area and destination outside of the area is counted.
- External-internal (XI): The full length of all trips with an origin outside of the project area and destination within the area is counted.

There are two additional adjustments that should be made to reach a total project generated VMT. First, because most VMT calculation methods multiply the number of trip ends by the trip length, the internal-internal VMT in the project area is double counted; convention generally divides the internal-internal VMT by two to compensate for this. Second, an adjustment to the project generated VMT should be made to include the full length of trips that leave the travel forecasting model area to fully capture interregional travel (an example may be a trip from Los Gatos to Sacramento; Sacramento is not included in any of the Bay Area travel models as a transportation analysis zone).

The total can be further broken down into components related to trips for specific purposes (for example, commute trips or shopping trips).

When describing VMT metrics in impact analysis, lead agencies should report project changes in absolute terms and consider whether an “efficiency form” of the metric such as total project generated VMT per service population (i.e., population plus employment) is meaningful for impact analysis.<sup>16</sup> Since emissions and energy impact analysis require absolute amounts of VMT as an input, total weekday VMT in absolute terms is the minimum requirement. The efficiency form of the metric is a VMT generation rate similar to a vehicle trip rate. In addition, since total VMT will increase or fluctuate with population and employment growth, changes in economic activity, and expansion of new vehicle travel choices (i.e., Uber, Lyft, autonomous vehicles, etc.), expressing VMT measurement in an efficiency metric form allows for more

---

<sup>16</sup> Many jurisdictions find it useful to express VMT as an efficiency metric (e.g., VMT per person or VMT per employee). This form of the metric is unrelated to the level of activity in a particular location and more about how efficiently the people at that location travel. A project that contributes to a more efficient use of the transportation system would reduce the total VMT per person as compared to a no-project scenario. A commonly used efficiency metric is “total VMT per service population,” in which the denominator called “service population” includes all of the variables that generate vehicle trips in the travel forecasting models that estimate VMT; in most instances this will include residents plus employees, and may also include other categories of people such as visitors or students if those categories are used in the trip generation estimates in the travel forecasting model.

direct comparisons to baseline conditions when it comes to land use projects, land use plans, and transportation projects.

**Project's effect on VMT** is estimated within a selected geographic boundary (e.g., town/city, county or region) and captures all VMT on the roadway network including both local trips and longer-distance travel that does not have an origin or destination within the area. It is often referred to as boundary VMT. It is a more complete evaluation of the potential effects of the project because it captures the combined effect of new VMT, shifting of existing VMT to/from other neighborhoods, and/or shifts in existing VMT to alternate travel routes or modes. The absolute change in VMT between a without project and with project condition can be compared directly if the land use totals are equal between scenarios. If the land use totals are different, the VMT should be divided by the service population (typically residents plus employees but may include other VMT generators like students and visitors) to distinguish the effects of population and/or employment growth from the effects of changes in personal travel behavior.

The land use changes for typical projects in the Town are relatively small compared to the total residential population and employment of the Town and the typical project is unlikely to have widespread regional VMT effects. Therefore, if using a travel model to estimate a smaller project's effect on VMT, the selected geographic region should be either the County or Town. However, the selected area should remain large enough to capture the VMT changes associated with the project. Additional considerations for smaller projects are discussed further in the VMT Calculation Methods chapter (Chapter 4).

## VMT Metrics for Other Resource Areas

As referenced earlier in this discussion of VMT metrics, a common practice for GHG, air quality, and energy consumption impact analysis is to use the following VMT produced using a local or regional travel forecasting models:

- Project generated VMT: Total project generated VMT with adjustments for trips that travel outside the model area and disaggregated by speed bin.<sup>17</sup> (This VMT metric may vary based on a local jurisdictions General Plan, Climate Action Plan, and regional air district requirements.)
- Project's effect on VMT within a select geography: Boundary VMT on all roadways within a geographic area disaggregated by speed bin.

Emissions vary by speed bin; disaggregating VMT by speed bin allows different emissions factors to be applied at different speeds, which allows for the preparation of a more refined emissions analysis.

---

<sup>17</sup> Total VMT by speed bin is the VMT on the roadway for a given speed range (typically a five mile an hour increment of speed from 0 to ~80 miles per hour). Emissions rates of criteria pollutants and GHG, and energy consumption vary based on vehicle speed. Thus, segmenting VMT by speed bin provides a more precise estimate of these emissions.

## Summary of VMT Metric Options

The following summary table (**Table 1**) clarifies the VMT metric, definition, VMT accounting specification, and potential use as an input for other CEQA sections including GHG, air quality, and energy consumption impact analysis. With the exception of Total Project Generate VMT per service population, each VMT metric listed in this table are described in the *Technical Advisory: On Evaluating Transportation Impacts in CEQA* (December 2018); see pages 5, 6 and 23, and Appendix 1 of the *Technical Advisory*. It is suggested that each of these VMT metrics be included so that all forms of VMT needed for screening and complete analysis are available (including total VMT by speed bin for air quality, GHG, and energy impact analysis).

<b>Table 1: Summary of Common VMT Metrics</b>				
<b>VMT Metric<sup>1</sup></b>	<b>Definition</b>	<b>Location of VMT Accounting Specification in this Document</b>	<b>Recommended by OPR</b>	<b>VMT used for other CEQA Sections?</b>
<b>Total Project Generated VMT</b>	Daily VMT of all vehicle trips, vehicle types, and trip purposes for all project land uses, presented as a total project generated VMT.	Project Generated VMT Accounting on page 16	Yes, for land use plans, and discussed in Appendix 1 of the OPR <i>Technical Advisory</i> .	Yes
<b>Total Project Generated VMT per Service Population<sup>2, 3</sup> (aka Total Project Generated VMT Rate)</b>	Daily VMT of all vehicle trips, vehicle types, and trip purposes for all project land uses, divided by the sum of residents plus employees.	Project Generated VMT Accounting on page 16 using Total VMT per Service Population.	No, although may be helpful for mixed-use projects and comparing land use scenarios, particularly when using a travel forecasting model.	Yes
<b>Partial Home-Based VMT per Resident<sup>4</sup> (aka Home-Based VMT Rate)</b>	VMT generated by light-duty vehicles for all trips that begin or end at a residential land use, divided by residents.	Project Generated VMT Accounting on page 16 using Home-Based VMT per Resident.	Yes, for residential projects on page 5 and Appendix 1 of OPR <i>Technical Advisory</i> .	No
<b>Partial Home-Based Work VMT per Employee<sup>4</sup> (aka Home-Based Work VMT Rate)</b>	VMT by light-duty vehicles only for work trips (that is, trips that have one end at a workplace and one end at a residence), divided by number of employees.	Project Generated VMT Accounting on page 16 using Home-Based Work VMT per Employee.	Yes, for office projects on page 6 and Appendix 1 of OPR <i>Technical Advisory</i> .	No

**Table 1: Summary of Common VMT Metrics**

VMT Metric <sup>1</sup>	Definition	Location of VMT Accounting Specification in this Document	Recommended by OPR	VMT used for other CEQA Sections?
<b>Project's Effect on VMT within the Boundary of a Specific Area (aka Boundary VMT)</b>	VMT that occurs within a selected geographic boundary (e.g., City, County, or region) by any type of vehicle. This captures all on-road vehicle travel on a roadway network for any purpose, and includes local trips as well as trips that pass through the area without stopping.	Boundary VMT on page 15.	Yes, for retail projects and transportation projects on pages 5, 6 and 23 and Appendix 1 of the OPR <i>Technical Advisory</i> .	Yes

Notes:

1. Each VMT metric is an option for baseline and/or cumulative impact analysis.
2. Total project generated VMT is derived from this VMT rate.
3. The project generated VMT accounting is similar to an origin-destination accounting used for many Climate Action Plans.
4. A partial VMT estimate.

Source: Fehr & Peers, 2020.

## **VTM METRICS: OPTIONS, LIMITATIONS, AND CONSIDERATIONS**

### **COMMON OPTIONS**

- Total Project Generated VMT
- Total Project Generated VMT per Service Population\*\*
- Household generated VMT per Resident (requires an activity/tour-based travel forecasting model)
- Home-Based VMT per Resident (a partial VMT estimate)
- Home-Based Work VMT per Employee (a partial VMT estimate)
- Project's Effect on VMT using Boundary VMT for a specific area

### **COMMON LIMITATIONS**

Metrics other than total VMT and total VMT per service population typically only represent partial VMT (i.e., some vehicle types and trip purposes are excluded in the models used to estimate VMT). This may be acceptable for screening purposes but not for a complete VMT impact analysis. Project-generated VMT metrics cannot capture how a project changes behavior of non-project residents or employees.

### **CONSIDERATIONS**

The expectations of a CEQA impact analysis to strive to provide a complete picture of the effects of a project on the environment are highlighted within the CEQA Guidelines. For lead agencies, VMT metrics and method should consider current practice for air quality, greenhouse gases (GHG), and energy consumption impact analysis. In general, VMT is used as an input for these other analyses and current practice is to produce VMT estimates and forecasts that comply with CEQA Guidelines expectations.

\*\* Service population includes population plus employment and may include students or visitors; it is intended to include all independent variables used in estimating trips.

## **VTM METRICS: TOWN OF LOS GATOS INITIAL RECOMMENDATIONS**

### **OPTION 1: RELY ON THE OPR *TECHNICAL ADVISORY* THRESHOLDS**

Include the following so that forms of VMT needed for screening and complete VMT analysis are available:

- Total Project Generated VMT
- Total Project Generated VMT per Service Population
- Home-based VMT per Resident
- Home-based work VMT per Employee
- Boundary VMT for an appropriate area affected by the Project (needed for air quality, GHG, and energy analysis)

### **OPTION 2: SET THRESHOLDS CONSISTENT WITH THE GENERAL PLAN FUTURE YEAR VMT PROJECTIONS**

Include the following so that forms of VMT needed for a complete VMT analysis are available:

- Total Project Generated VMT
- Total Project Generated VMT per Service Population
- Boundary VMT for an appropriate area affected by the Project (needed for air quality, GHG, and energy analysis)

# Chapter 4. VMT Calculation Methods

## What Methods are Available to Use in Estimating and Forecasting VMT?

VMT forecasts are generated using various forms of travel forecasting models that range from simple spreadsheets based on historic travel trends to complex computer models that account for numerous factors influencing travel demand. Possible travel forecasting models/tools include:

- Travel Forecasting Models: A travel forecasting model is a computer model used to estimate travel behavior for a specific horizon year based on land use and transportation network supply inputs. VMT is one output of a travel forecasting model run. The Caltrans Statewide Travel Forecasting Model, Metropolitan Transportation Commission (MTC) Regional Travel Forecasting Model, and VTA-C/CAG Bi-County Travel Forecasting Model are all examples of travel forecasting models.
- Non-model "Accounting Methods": In some cases where a travel model is not available or not appropriate, VMT can be estimated using sketch models or spreadsheet tools. VMT can also be estimated directly by multiplying the number of trips by an average trip length. Trips can be estimated using trip generation surveys or trip generation rate data. Trip lengths can be extracted from models or from standardized averages or travel pattern data from the regional or sub-regional planning organization. Using trip length averages does not consider changes to the roadway network or traffic congestion, or the project's potential effects on overall travel patterns. These non-model "Accounting Methods" could also be paired with a travel model and used between major model updates or to estimate project generated VMT for small projects that would "get lost in a model." The forthcoming Santa Clara Countywide VMT Estimation Tool is an example of VMT screening tools that use outputs from a travel forecasting model and conducts off-model VMT reduction calculations to test potential transportation demand management strategies to reduce VMT.

## Selecting a Model for Calculating VMT

An ideal tool for an SB 743 VMT analysis is a travel forecasting model that has been appropriately calibrated and validated for local project size and scale and has trip length data that accounts for trips that extend beyond the model boundary. Many travel forecasting models also account for travel patterns due to congestion, public transit, and non-motorized transit (walking and biking).

### Travel Forecasting Models

The National Cooperative Highway Research Program (NCHRP) Report 765, *Analytical Travel Forecasting Approaches for Project-Level Planning and Design*, Transportation Research Board (TRB) (2014) is a detailed

resource with many applicable sections. A few highlights related to forecasting expectations for models are listed below:

- A travel forecasting model should be sensitive to the policies and projects that the model is expected to help evaluate.
- Project-level travel forecasts should be validated following the guidelines of the *Travel Model Validation and Reasonableness Checking Manual*, Second Edition from the Federal Highway Administration (FHWA).
- The model should be recalibrated frequently to ensure that validation standards are continuously met.

If used as the primary basis for calculating VMT, selection of an appropriate travel forecasting model is an important step. It is important for consistency because the model used to develop VMT thresholds should also be used to evaluate a project's direct and cumulative VMT impacts. The OPR *Technical Advisory* emphasizes this point (*Technical Advisory: On Evaluating Transportation Impacts in CEQA*, page 6).

*"It is critical, however, that the agency be consistent in its VMT measurement approach throughout the analysis to maintain an "apples-to-apples" comparison. For example, if the agency uses a home-based VMT for the threshold, it should also be use home-based VMT for calculating project VMT and VMT reduction due to mitigation measures."*

The VTA Travel Model includes a more detailed representation of the Town of Los Gatos transportation network and land use patterns compared to the MTC Travel Model. A comparison of the available travel forecasting models for the Town of Los Gatos is shown in **Appendix B**.

Using a travel forecasting model has some advantages over other methods, such as using sketch models or spreadsheet tools, because a travel model is better able to account for both project generated VMT and the project's effect on total area-wide VMT. A spreadsheet tool cannot evaluate project's effect on VMT. Both project generated and the project's effect on total VMT (as noted earlier) are important in a CEQA analysis. In addition, travel forecasting models can help identify the effects of transportation projects on VMT: for instance, would adding an additional vehicle lane induce new VMT, or cause people to drive who otherwise wouldn't have?

A travel forecasting model should have a base year and a future year, which are needed to evaluate project and cumulative impacts. As noted above, lead agencies have discretion to choose their analysis methods. However, if they prefer to establish thresholds that rely on regional averages of baseline VMT, then the travel forecasting model must cover a large enough area. The OPR *Technical Advisory* cites the importance of not truncating trip lengths based on travel forecasting model or political boundaries:

**Considerations for All Projects.** *Lead agencies should not truncate any VMT analysis because of jurisdictional or other boundaries, for example, by failing to count the portion of a trip that falls outside the jurisdiction or by discounting the VMT from a trip that crosses a jurisdictional boundary.*

*CEQA requires environmental analyses to reflect a "good faith effort at full disclosure." (CEQA Guidelines, § 15151.) Thus, where methodologies exist that can estimate the full extent of vehicle travel from a project, the lead agency should apply them to do so. Where those VMT effects will grow over time, analyses should consider both a project's short-term and long-term effects on VMT. (Quote from page 6 of the Technical Advisory: On Evaluating Transportation Impacts in CEQA, December 2018).*

Some regional travel forecasting models used by metropolitan planning organizations (MPOs) have sufficient geographic coverage to produce these estimates although they typically truncate trip lengths at the model boundary (usually meaning that inter-regional VMT is not fully captured without adjustments in the VMT forecasts). This can be an important limitation for towns, cities, or counties at the edge of the travel forecasting model boundary.

In addition to concerns around truncating trips, most models cannot analyze transportation effects at the parcel or project level because the most disaggregate level of land use in a travel model is the transportation analysis zone (TAZ).<sup>18</sup> These TAZ boundaries are not artificial, and substantial effort is usually applied when designing a TAZ system. While a project may be one or several parcels, the finest level a VMT analysis should be conducted on (absent supporting substantial evidence of statistical validity) is the TAZ. As such, it does present a limitation for analysis of smaller areas at the sub-TAZ level. The response to this type of limitation is to modify the model to add detail and split TAZs.

Should an analyst identify noise or anomalies in the VMT results, further testing and investigation is needed to diagnose and understand the cause and prepare an appropriate solution. The solution may result in minor refinements to the TAZ structure (as noted above), update land use or transportation network inputs, or more comprehensive improvements to ensure the travel model is sufficiently accurate and sensitive to the local-scale applications.

The TAZ size also influences the types of streets vehicle traffic is typically assigned to. For a regional forecasting model an arterial or minor arterial is the lowest street level that traffic is assigned to; for a sub-regional/local travel forecasting model it is typically a collector or possibly local streets. As such, for most travel forecasting model uses, VMT on smaller streets is not calculated.

Lead agencies should be aware that regional models 'off the shelf' are often not designed to be sensitive to local-scale applications such as individual land use project analysis. Calibration and validation of the model within the project study area is typically needed including refinements and modifications to better represent the project and its effects.

The OPR *Technical Advisory* states that sketch level models may be used for project VMT analysis if the trip lengths are replaced with those from the local or regional model that was used to establish the lead agency's VMT thresholds. To be fully consistent, the trip generation estimates of the sketch model would

---

<sup>18</sup> As defined by NCHRP Report 716, *Travel Demand Forecasting: Parameters and Techniques*, TRB, 2012, "TAZ boundaries are usually major roadways, jurisdictional borders, and geographic boundaries and are defined by homogeneous land uses to the extent possible."

also have to be replaced. Unfortunately, most travel forecasting models do not use typical project land uses as trip generation inputs making this substitution difficult.

### **Non-Model Spreadsheets and Sketch Planning Tools**

Sketch planning tools vary from simple spreadsheets that multiply a project's expected vehicle trip generation by an average trip length to more complex calculations that incorporate some level of land use context and project detail. Examples of the latter type of model include CalEEMod and the EPA's MXD+ methods for evaluating mixed-use projects, both of which are commonly used for trip generation or air quality analysis under current CEQA practice.

VTA is currently in the process of developing a web application that will screen and estimate project generated VMT and VMT reductions for land use projects in the Town of Los Gatos. The types of land use projects would include residential, office, and industrial land uses, those land uses in combination with each other, and those land uses with or without ancillary retail space. The SCC VMT Evaluation Tool will be modular such that the VTA, along with the cities and towns in Santa Clara County and the County of San Clara can include their specific VMT screening requirements or VMT data within the SCC VMT Evaluation Tool. The web application will be scalable such that it can be used for a range of project sizes and location within any jurisdiction in Santa Clara County. This web application will include the partial Home-based VMT per Resident and Partial Home-based Work VMT per Employee, and has the potential to include Total VMT per service population, boundary VMT and a project's effect on VMT Screening.

## VMT CALCULATION METHODS: OPTIONS, LIMITATIONS, AND CONSIDERATIONS

### COMMON OPTIONS

1. Caltrans Statewide Travel Demand Model
2. Metropolitan Transportation Commission (MTC) Regional Travel Forecasting Model
3. VTA-C/CAG Bi-County Travel Forecasting Model
4. Local Town of Los Gatos Travel Forecasting Model (not currently available)
5. Non-model "Accounting Methods" such as sketch planning tool or spreadsheet\*\*

### COMMON LIMITATIONS

Statewide and regional models have limited sensitivity and accuracy for local scale applications off the shelf. Regional and local models often truncate trips at model boundaries. Sketch and spreadsheet tools do not capture the 'project effect on VMT'.

### CONSIDERATIONS

Selection of an appropriate travel forecasting approach is an important step because the tool used to develop VMT thresholds must also be used to evaluate a project's direct and cumulative VMT impacts. Regional or local models should be calibrated and validated for local project-scale sensitivity/accuracy (including appending trip length data for trips with external trip ends) before using these models to analyze both 'project generated VMT' and 'project effect on VMT.'

\*\*Sketch planning tool or spreadsheet method has limitations if using a citywide or regional average for a threshold.

## VMT CALCULATION METHODS: TOWN OF LOS GATOS INITIAL RECOMMENDATIONS

### OPTION 1: RELY ON THE OPR TECHNICAL ADVISORY THRESHOLDS

Use the Santa Clara Countywide VMT Evaluation Tool for baseline VMT screening, And most likely the VTA-C/CAG Bi-County Travel Forecasting Model, Local Town of Los Gatos Travel Forecasting Model (not currently available), or Non-model "Accounting Methods" such as sketch planning tool or spreadsheet.

### OPTION 2: SET THRESHOLDS CONSISTENT WITH THE GENERAL PLAN FUTURE YEAR VMT PROJECTIONS

Most likely the VTA-C/CAG Bi-County Travel Forecasting Model, Local Town of Los Gatos Travel Forecasting Model (not currently available), or Non-model "Accounting Methods" such as sketch planning tool or spreadsheet.

# Chapter 5. VMT Impact Significance Thresholds

Since SB 743 introduces a new mandatory metric for use in CEQA analysis, lead agencies will need to determine what constitutes acceptable and unacceptable levels of VMT. This process is generally referred to as establishing significance thresholds and is governed by *CEQA Guidelines* Section 15064.7, which states the following:

*15064.7. THRESHOLDS OF SIGNIFICANCE. (a) Each public agency is encouraged to develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects. A threshold of significance is an identifiable quantitative, qualitative or performance level of an environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant. (b) Thresholds of significance to be adopted for general use as part of the lead agency's environmental review process must be adopted by ordinance, resolution, rule, or regulation, and developed through a public review process and be supported by substantial evidence. (c) When adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.*

In more general terms, this indicates that agencies are now encouraged to formally adopt thresholds of significance for VMT, and that they have leeway to consider a wide variety of opinions from public agencies and experts. Ultimately, agencies have discretion to determine a threshold of significance, either on a case-by-case basis or through a more formal adoption process, provided that they can present substantial evidence that the threshold is set at a level that would normally be considered to have a significant environmental impact.

For projects that are not able to meet the established threshold, the VMT impact would be considered significant and unavoidable, preparation of an Environmental Impact Report (EIR) would be required, and approval of the project would require the adoption of a Statement of Overriding Considerations.

With regard to establishing thresholds for VMT, lead agencies have at least four options:

## **1) Use Screening Criteria.**

The concept of project screening is that some projects have characteristics that readily lead to the conclusion that they would not cause a VMT impact, and therefore could be screened out of doing a detailed VMT analysis. The *CEQA Guidelines* state that projects within ½ mile of a major

transit stop or a stop along a high-quality transit corridor (i.e., with at least 15-minute headways during peak hours) should be presumed to have no impact on VMT.

In addition, the OPR *Technical Advisory* presents a method for “map-based” screening, where projects located in low-VMT areas may require only a qualitative discussion of their VMT effects, provided they comply with best practices for infill development. The areas that would qualify as “low-VMT” areas would depend on how the Town defines its VMT metrics and thresholds relative to baseline conditions. One method for conducting project screening is to develop a GIS-based mapping tool that shows the locations of the transit priority areas and the low-VMT areas and allows the analyst to plot their project location to see if it meets the screening criteria.

Land use projects may also be screened out of further analysis if they are very small or can be demonstrated to primarily attract trips that would otherwise travel longer distance. Further, certain transportation projects, such as installation of bicycle/pedestrian/transit infrastructure, or projects designed to address a localized operational issue, can be presumed not to contribute to increased VMT.

**2) Rely on the OPR Technical Advisory suggestion to set thresholds consistent with state goals for air quality, GHG and energy conservation.**

The OPR *Technical Advisory* contains suggested VMT thresholds. The basic suggested threshold is that each project achieves a VMT level that is at least 15% below baseline conditions. In the case of the Town of Los Gatos, its “region” would be the nine-county Bay Area.

**3) Use a threshold adopted or recommended by another public agency consistent with lead agency air quality, GHG reduction, and energy conservation goals.**

The *CEQA Guidelines* offer the option for an agency to use a threshold that is adopted or recommended by another agency, as long as that decision is supported by substantial evidence. Other state agencies, such as Caltrans and the California Air Resources Board (CARB), have technical expertise that is relevant to this topic.

CARB has produced several reports and studies that speak to the level of VMT reduction, in conjunction with many other measures, that would lead to the achievement of the state’s GHG goals. Recent CARB publications have identified that new land use projects could contribute to these statewide goals by achieving total project generated VMT levels of at least 14.3% below the existing baseline (the CARB report does not specify whether this “baseline” is the regional average or some other baseline). For light-duty vehicles only, CARB cites a 16.8% reduction below baseline (2018) average VMT. However, the CARB analysis assumes that all of the regions in the state will meet the GHG reduction targets set in their Regional Transportation Plans and Sustainable Communities Strategies (RTP/SCS); thus far, indications are that not all regions are meeting those targets, and vehicular travel in California (at least prior to the COVID-19 pandemic) has been increasing rather than decreasing over the past several years. Further, the CARB analysis does not

account for any future increases in the use of Transportation Network Companies (such as Uber and Lyft) or commercial delivery services, nor does it envision the potential for development of autonomous vehicles or any other emerging transportation innovations. Therefore, there is growing evidence that the VMT reduction values from the CARB publication may not be enough to actually meet the State's GHG goals. Should current VMT generation trends persist, the threshold may need to increase to 25% below baseline (2018) average of jurisdiction (all vehicles).

Caltrans has released draft guidance endorsing the VMT thresholds published in the OPR *Technical Advisory*. Caltrans does acknowledge that each lead agency has the discretion to set its own significance thresholds, and they will be reviewing the evidence presented by any agency that uses a threshold that differs from those in the *Technical Advisory*.

Separately, Caltrans has released draft Interim Guidance on "*Determining CEQA Significance for GHG Emissions for Projects on the State Highway System*" that recommends that any increase in GHG emissions would constitute a significant impact. This has been referred to as the "Net Zero VMT threshold". While Caltrans has thus far signaled that this threshold would be applied only to transportation projects, it does raise a question about whether a "net zero VMT" threshold should also be applied to land use projects and plans.

#### **4) Develop jurisdiction-specific VMT threshold consistent with existing General Plan.**

Agencies may decide to set their own thresholds, which should be supported by substantial evidence and should support the three objectives laid out in SB 743: 1) reducing GHG emissions, 2) encouraging infill development, and 3) promoting active transportation. The process of setting thresholds should consider the policies and standards set in the RTP/SCS, and should consider how much priority the Town wants to place on the statewide GHG reduction goals, which relies on the VMT growth budget established in the General Plan and associated EIR. A targeted study could determine what level of VMT in the Town of Los Gatos would be consistent with the VMT forecasts presented in Plan Bay Area and would represent the Town's "fair share" of the State's GHG reduction goals.

Another option for setting a local threshold is to consider what level of VMT reduction is feasible to achieve in the local context. Analysis tools are available to estimate the amount of VMT reduction that can be achieved from different types of mitigation strategies deployed in different settings (as described further in Chapter 6). Applying these tools to the range of settings that exists in the Town of Los Gatos would yield an estimate of the amount of VMT mitigation that could feasibly be achieved, and that figure could then be incorporated into a VMT threshold. Setting a threshold based on the feasibility of mitigation may not be fully supported by past CEQA practices; Fehr & Peers advises consulting legal counsel and continuing to follow legal developments before adopting this approach.

Establishing CEQA thresholds for VMT requires complying with the statutory language added by SB 743, as well as guidance contained in *CEQA Guidelines* Section 15064, 15064.3, and 15064.7. The excerpts in

**Appendix F** highlight the amendments to the two *CEQA Guidelines* Sections that were certified by the California Natural Resources Agency and the Office of Administrative Law at the end of 2018.

In addition, the Town must determine significance thresholds for each of the three project types: land use projects, land use plans, and transportation projects.

## Context for Setting VMT Impact Thresholds

California law<sup>19</sup> states that the criteria for determining the significance of transportation impacts must promote: (1) reduction of greenhouse gas emissions; (2) development of multimodal transportation networks; and (3) a diversity of land uses.

Determining an appropriate VMT significance threshold may ultimately depend on whether the courts treat VMT more like air pollution and less like level of service (LOS). If VMT causes adverse effects to human health similar to air pollution, then the threshold should be tied to substantial evidence (i.e., scientific studies) that relate VMT to human health (or human welfare or safety). If this effect varies by area type, then different thresholds may be appropriate. Currently (May 2020), the limited scientific evidence related to VMT changes and their potential for causing adverse effects on humans is the CARB *2017 Scoping Plan*. This analysis did not differentiate by area type so a change in rural VMT has no different effect on humans than a change in urban VMT. The VMT would still generate the same amount of GHG emissions (and air pollutant emissions plus other indirect adverse effects) that would still have the same contribution to climate change.

On the other hand, if VMT is treated more like LOS, then lead agencies would have a similar level of discretion to establish thresholds based on context (i.e., sensitivity to the amount of vehicle travel). Past practice allowed lead agencies to set LOS thresholds based largely on the local community's sensitivity to travel delay. This is consistent with CEQA Guidelines Section 15064: "...An ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting. For example, an activity which may not be significant in an urban area may be significant in a rural area." Rural areas that were more sensitive were allowed to establish LOS thresholds that equated to lower levels of delay. Using this analogy, a lead agency could set VMT thresholds based on a community's sensitivity to the amount of vehicle travel or its associated effects.

## Is the Use of VMT Impact Screening Desired?

There are several instances where CEQA statute allows for projects to be "screened" out of more detailed analysis. The screening process refers to a relatively quick assessment of the project based on screening criteria discussed below; if the project passes the screening assessment, it can be presumed to have a less-than-significant impact on VMT. Screening may be based on project location, project characteristics,

---

<sup>19</sup> Section 21099 of California Public Resources Code codifies the required changes to the guidelines implementing CEQA as mandated in Senate Bill 743. Section 21099 includes a requirement that the criteria for determining the significance of transportation impacts must "promote the reduction of greenhouse emissions, the development of multimodal transportation networks, and a diversity of land uses".

or a combination of both. Lead agencies are responsible for deciding if projects may screen themselves from further analysis, determining which screening criteria they want to use for which project types, and where to set a screening “threshold”.

### **Projects Located Near Frequent and High Capacity Transit**

*CEQA Guidelines § 15064.3(b)* explicitly states that projects within ½ mile of a high-quality transit corridor or major transit station should be presumed to have no impact on VMT. A major transit station is a rail or ferry terminal, or the location where two high-frequency bus lines intersect. A major transit corridor is defined as a corridor with high-frequency bus service in the peak hour. The Town has some discretion whether to define these areas as ½-mile walksheds or ‘as the crow flies.’ However, existing transit service in the Town generally does not meet this threshold.

### **Projects Located in Low-VMT Generating Area**

In addition, the OPR *Technical Advisory* presents a method for “map-based” screening, where projects located in low-VMT areas may require only a qualitative discussion provided they comply with planning best practices for infill development. A low VMT area is generally defined as one where the VMT per resident under Existing Conditions (based on a model run) is below the impact threshold adopted by the lead agency. The rationale behind screening based on location in a low-VMT area is that future residents, employees, and visitors are likely to have similar travel patterns to current populations in the study area. Therefore, if a project includes elements that are substantially different from existing development patterns, additional analysis may be necessary even if the area has a low level of VMT generation under Existing Conditions.

### **Local-Serving Retail Projects**

Local-serving retail is unlikely to have a substantial influence on local VMT. Smaller retail uses such as grocery stores, dry cleaners, pharmacies, and convenience stores tend to attract visitors from nearby neighborhoods. As an example, consider the effect of a new grocery store in an area without one. Residents of a neighborhood without a grocery store have to travel a great distance to an existing grocery store. Adding the grocery store to that neighborhood will shorten many of the existing grocery shopping trips and reduce the VMT to/from the neighborhood, while it is unlikely to attract visitors who are already near an existing grocery store. While the definition of local-serving retail is somewhat subjective, a reasonable screening criterion may be a grocery store, pharmacy, or shopping center that does not exceed 50,000 square feet of retail space.

### **Specific Transportation Projects**

Some transportation projects are highly unlikely to create VMT impacts, and can be presumed to have a less-than-significant impact on VMT. These include projects that reduce the number of lanes on a roadway (“road diets”), bicycle and pedestrian infrastructure projects, traffic calming projects, minor signal timing adjustments, and other roadway projects that are not intended to add vehicle capacity or reduce vehicle delay. **Appendix G** includes the complete list provided in the OPR *Technical Advisory* (December

2018, Pages 20-21) for transportation projects that “would **not** likely lead to a substantial or measurable increase in vehicle travel, and therefore generally should not require an induced travel analysis.”

### **Projects with No Net VMT Increase**

Some projects may be reasonably expected to have no net effect on VMT. These would include like-for-like land use replacement projects, development of a site with a less-intensive land use than the existing land use, or any other project that is not expected to cause a change in travel behavior to or from the project site.

### **Affordable Housing Projects**

The OPR *Technical Advisory* indicates that 100 percent affordable housing projects in infill locations may be screened from further analysis based on evidence that affordable housing both generates less VMT per resident than market-rate housing, and may help improve jobs-housing balance. The Town may wish to develop its own screening criteria for residential projects (or residential portions of mixed-use projects) containing a particular amount of affordable housing, based on local circumstances and evidence.

### **Small Projects**

The Town may continue to issue guidance regarding when a full transportation impact analysis is necessary by, for instance, allowing the screening of small projects from VMT analysis, or requiring only qualitative VMT assessment for small projects. Screening based on small projects may wish to follow the definition of a small project presented in *CEQA Guidelines 15179.5*, which includes multi-family developments of 100 units or less and retail or mixed-use commercial of 100,000 square feet or less. Or use the criteria cited in the OPR *Technical Advisory* (page 12) to screen projects that generate or attract fewer than 110 vehicle trips per day. Based on research for small project triggers<sup>20</sup>, this may equate to nonresidential (e.g., office) projects of 10,000 square feet or less and residential projects of 20 units or less. The Town of Los Gatos may also screen local-serving retail projects (projects with less than 50,000 square feet of retail) on the basis that they attract trips that would otherwise travel longer distances.

---

<sup>20</sup> Refer to technical memorandum on small project triggers in **Appendix H**.

## SCREENING: OPTIONS, LIMITATIONS, AND CONSIDERATIONS

### COMMON OPTIONS

Projects that reduce VMT or are located within transit priority areas (TPAs) should be presumed to have a less than significant impact on VMT. Additional screening options identified in the OPR Technical Advisory for:

1. Map based screening for residential and office projects
2. Local-Serving Retail Projects
3. Transportation projects that do not add vehicle capacity
4. Projects that would not result in a net increase of VMT
5. Affordable housing projects
6. Small projects

### COMMON LIMITATIONS

Screening does not provide information about the actual VMT changes associated with the project.

### CONSIDERATIONS

Screening most appropriate if consistent with applicable general plan and supported by substantial evidence.

## SCREENING: TOWN OF LOS GATOS INITIAL RECOMMENDATIONS

### OPTION 1: RELY ON THE OPR *TECHNICAL ADVISORY* THRESHOLDS

Rely on screening if consistent with applicable general plan and supported by substantial evidence demonstrating cumulative VMT is declining. For project-by-project VMT analysis with VMT screening, most projects will likely not screen out, which will require a more complete VMT analysis.

Apply screening for the following project types:

- Small Developments
- Projects in Low-VMT Areas
- Projects in Proximity to Major Transit Stops
- Affordable Housing
- Local-Serving Retail Projects less than 10,000 square feet
- Transportation Projects that do not add vehicle capacity

The Santa Clara Countywide VMT Estimation Tool will be applied for screening as follows:

- Low VMT generation map-based screening of residential, office, and industrial land uses, those land uses in combination with each other, and those land uses with or without local serving retail space.
- A transit priority areas (TPAs)/major transit stops and high-quality transit corridor (HQTC) screen.

### OPTION 2: SET THRESHOLDS CONSISTENT WITH THE GENERAL PLAN FUTURE YEAR VMT PROJECTIONS

Screening not used for this approach. Rather than analyzing VMT for each proposed land use project individually, projects consistent with the General Plan could be exempt from further VMT impact analysis since VMT impacts would have been analyzed in the General Plan EIR.

## What is the VMT Impact Significance Threshold for Land Use Projects and Land Use Plans Under Baseline Conditions?

Specific VMT thresholds for residential, office (work-related), and retail land uses from the OPR *Technical Advisory* are summarized below.

- Residential projects: A proposed project exceeding a level of 15 percent below existing (baseline) VMT per capita may indicate a significant transportation impact. Existing VMT per capita may be measured as regional VMT per capita, a townwide VMT per capita, or as geographic sub-area VMT per capita.
- Office projects: A proposed project exceeding a level of 15 percent below existing (baseline) regional VMT per employee may indicate a significant transportation impact.
- Retail projects: A net increase in total (boundary) VMT may indicate a significant transportation impact.
- Mixed-use projects: Lead agencies can evaluate each component of a mixed-use project independently and apply the significance threshold for each project type included (e.g., residential and retail). Alternatively, a lead agency may consider only the project's dominant use. In the analysis of each use, a project should take credit for internal capture.
- Other non-residential project types: OPR recommends using the quantified thresholds above, thus a proposed project exceeding a level of 15 percent below existing regional VMT per employee for the proposed non-residential project type or resulting in a net increase in total VMT may be considered significant. Lead agencies, using more location-specific information, may develop their own more specific thresholds, which may include other land use types.
- Redevelopment projects: Where a project replaces existing VMT-generating land uses, the OPR *Technical Advisory* recommends that if the replacement leads to a net overall decrease in VMT, the project would lead to a less-than-significant transportation impact. If the project leads to a net overall increase in VMT, then the thresholds described above should apply.

As shown above, OPR makes different recommendations for employment land use projects. In some cases, OPR recommends a 15-percent reduction in per capita VMT, in some cases no increase in boundary VMT, and in some cases OPR leaves threshold selection to jurisdiction discretion. Evidence is lacking on what justifies different treatments across different land use types. Lead agencies that use the above thresholds should be prepared to justify their reasoning and be able to explain it to project applicants, decision makers, and the public.

This presumption was included in the CARB modeling of MPO regional transportation plan/sustainable communities strategies (RTP/SCSs). The CARB *Scoping Plan* and *Mobile Source Strategy* identifies that a 14.3 percent reduction in total VMT per capita or a 16.8-percent reduction in light-duty vehicle VMT per capita from 2018 baseline levels is necessary to meet state GHG reduction goals by 2050. These reduction

values are based on a fair share estimate of new development's responsibility for VMT reduction and presume that all California residents in the year 2050 will be performing at the reduced VMT levels. If existing residents (meaning those present in 2018) do not change their travel behavior and the full reduction in VMT had to be allocated only to new growth, then the reduction goal for new developments would be much higher. Further, if VMT per capita trends continue to increase as noted in the *2018 Progress Report California's Sustainable Communities and Climate Protection Act*, California Air Resources Board, November 2018, then these reduction percentage values will have to increase.

It should be noted that the recommendation above for mixed-use projects to focus the VMT analysis on the "dominant use" may present new challenges. The term "dominant use" is not defined in the CEQA statute or CEQA Guidelines. As such, there are many ways to define it, which could simply create more legal arguments for challenging projects.

The Town has several possible thresholds to consider. One of the options is based on state goals pertaining to air quality, GHG reduction, and energy conservation, while another option would be based on the existing General Plan. Background on VMT thresholds and additional discussion of potential options are presented in **Appendix F**. The Town must determine whether it wishes to analyze VMT impacts based on guidance from statewide agencies, the Town's General Plan, or a combination of both. If the Town opts to use state guidance, it must determine which agency's threshold to use, and its standards for determining "significant evidence" for setting a threshold at that level. The primary consideration in determining what constitutes significant evidence revolves around which goals the Town focuses on (GHG emissions, promoting infill development, or promoting active transportation) and how trends in VMT are projected forward to meet those goals.

Also, once available, the VTA Travel Model may be used to prepare baseline and cumulative VMT estimates for each of the VMT metrics described in the previous chapter (see **Appendix I** for the latest home-based VMT and home-based work VMT estimates from VTA's travel model).

### **Set Threshold Based on State Goals**

This option sets a threshold consistent with a lead agency's air quality, GHG reduction, and energy conservation goals, presuming they are aligned with, or even exceed, state goals. Debate still exists about whether state goals as expressed in state plans, Governor executive orders, etc., constitute environmental thresholds. Nevertheless, OPR, CARB, and Caltrans articulated quantitative estimates for VMT/GHG reduction needed to achieve state GHG reduction goals.

Given the CARB regulatory responsibility related to emissions and the Caltrans owner/operator responsibility for the state highway system, their published guidance for VMT impact analysis should be recognized and at least discussed in transportation impact analysis. Including this information will help inform decision makers and the public how the state and these specific agencies view VMT effects of projects. One benefit of relying on state agencies for a threshold recommendation is a *CEQA Guidelines* provision in Section 15064.7(c) that indicates "a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts".

At the time of this document, there are actually five published percent reduction targets, and a possible Caltrans-recommended threshold:

- OPR: 15% below baseline average for a town/city or region (light-duty vehicles only).<sup>21</sup>
- CARB: 14.3% below baseline (2018) average of jurisdiction (all vehicles, presuming that MPOs meet SB 375 targets).
- CARB: 16.8% below baseline (2018) average of jurisdiction (light-duty vehicles only, presuming that MPOs meet SB 375 targets).
- CARB: 25% below baseline (2018) average of jurisdiction (all vehicles, presuming that MPOs do not meet SB 375 targets).
- Net zero VMT (the threshold that Caltrans has indicated they are likely to recommend for transportation projects that affect the state highway system <sup>22</sup>)

The OPR *Technical Advisory* makes specific VMT threshold recommendations for analyzing the impact of project generated VMT on baseline conditions but also recommends that VMT analysis consider a project's long-term effects on VMT. The OPR *Technical Advisory* states (p. 6):

*[W]here methodologies exist that can estimate the full extent of vehicle travel from a project, the lead agency should apply them to do so. Where those VMT effects will grow over time, analyses should consider both a project's short-term and long-term effects on VMT.*

Another factor for consideration is whether the project is consistent with the applicable RTP/SCS. Although OPR recommends that such consistency not be the sole basis for impact analysis (p. 22), it can be considered in conjunction with other factors especially whether a project would jeopardize the RTP's air quality conformity, which is tied directly to VMT. These recommendations raise key questions for lead agencies, as addressed in the next section.

### **Set Threshold Consistent with Existing General Plan**

This option relies on the VMT growth budget established in the general plan and associated EIR. A General Plan establishes how much growth is anticipated in the jurisdiction, where that growth will occur and in what forms, plus the transportation network modifications necessary to support that growth. VMT is a composite metric that results from this combination of general plan land use and transportation decisions. Therefore, each adopted general plan in California effectively already has a VMT growth budget implied within the Plan that the adopting agency has accepted.

---

<sup>21</sup> The OPR and CARB thresholds do not consider the long-term influence of transportation network companies, internet shopping, new mobility options, or autonomous vehicles.

<sup>22</sup> Caltrans is developing a threshold recommendation for land use projects for intergovernmental review (IGR) purposes. Local jurisdictions should consider whether a Caltrans or (CARB) threshold constitutes a state threshold that must be applied in addition to their local threshold preference similar to past practices for LOS impact analysis of the state highway system.

This could be a starting point for threshold expectations and can be quantified using the lead agency's travel forecasting model, if one exists, or from regional travel forecasting models used to develop the region's RTP/SCS. The incremental difference between base year and future year VMT generated by the jurisdiction in these models represents currently accepted VMT levels. The VMT can be expressed in absolute terms or as an efficiency metric, such as total VMT per service population to create a VMT impact threshold tied exclusively to the general plan. Projects can be evaluated using the appropriate travel forecasting model to determine whether they cause an increase in the incremental total VMT growth for the jurisdiction or would generate VMT at a higher rate than anticipated by the general plan for the relevant traffic analysis zone(s).

The main limitation of this approach is that the Town's adopted General Plan 2020 was developed prior to state approval of a variety of new laws related to climate change and GHG reduction. As such, the General Plan 2020 may not be consistent with state expectations for emissions and VMT reductions and all the other local community objectives.

### **Additional Considerations for Land Use Plans**

Rather than analyzing VMT for each proposed land use project individually, a jurisdiction may choose to complete VMT impact analysis as part of its General Plan EIR and make specific use of *CEQA Guidelines* Section 15183 (See Chapter 7 and Appendix F for additional discussion). Setting a threshold for the general plan itself and analyzing VMT impacts in the general plan EIR could exempt projects consistent with the general plan from further VMT impact analysis. The jurisdiction may adopt a threshold that is based on substantial evidence, use it in the general plan EIR, determine if VMT impacts are significant, mitigate to the extent feasible, and adopt a statement of overriding consideration if determined to be appropriate. The lead agency can then tier off the general plan EIR for projects consistent with the general plan without doing additional VMT impact analysis.

## BASLINE VMT THRESHOLDS: OPTIONS, LIMITATIONS, AND CONSIDERATIONS

### COMMON OPTIONS

1. Lead agency discretion consistent with general plan and expectations for 'project scale' VMT reductions not accounted for in general plan EIR and supported by substantial evidence.
2. OPR 15 % below baseline average for a town/city or region (light-duty vehicles only, based on initial assessment of feasibility and requirements to meet statewide GHG goals).\*\* This could potentially also be applied to below a baseline average for a place type.
3. CARB 14.3% below baseline (2018) average of jurisdiction (all vehicles, presuming that MPOs meet SB 375 targets). This could potentially also be applied to below a baseline average for a place type.
4. CARB 16.8 % below baseline (2018) average of jurisdiction (light-duty vehicles only, presuming that MPOs meet SB 375 targets). This could potentially also be applied to below a baseline average for a place type.
5. CARB 25 % below baseline (2018) average of jurisdiction (all vehicles, presuming that MPOs do not meet SB 375 targets). This could potentially also be applied to below a baseline average for a place type.
6. Pending Caltrans-recommended threshold (net zero VMT)

### COMMON LIMITATIONS

Difficult for lead agencies to determine what level of VMT change is unacceptable when viewed solely through a transportation lens. Uncertainty of VMT trends contributes to difficulty in setting thresholds. Connecting a VMT reduction expectation to baseline helps to reduce uncertainty associated with future conditions.

### CONSIDERATIONS

Since VMT is already used in air quality, GHG, and energy impact analysis, lead agencies should review

## BASLINE VMT THRESHOLDS: TOWN OF LOS GATOS INITIAL RECOMMENDATIONS

### OPTION 1: RELY ON THE OPR *TECHNICAL ADVISORY* THRESHOLDS

Specific VMT thresholds for residential, office (work-related), and retail land uses from the OPR *Technical Advisory* are summarized below.

- Residential projects: A proposed project exceeding a level of 15 percent below existing (baseline) VMT per capita may indicate a significant transportation impact. Existing VMT per capita may be measured as regional VMT per capita, a townwide VMT per capita, or as geographic sub-area VMT per capita.
- Office projects: A proposed project exceeding a level of 15 percent below existing (baseline) regional VMT per employee may indicate a significant transportation impact.
- Retail projects: A net increase in total (boundary) VMT may indicate a significant transportation impact.
- Mixed-use projects: Lead agencies can evaluate each component of a mixed-use project independently and apply the significance threshold for each project type included (e.g., residential and retail). Alternatively, a lead agency may consider only the project's dominant use. In the analysis of each use, a project should take credit for internal capture.
- Other non-residential project types: OPR recommends using the quantified thresholds above, thus a proposed project exceeding a level of 15 percent below existing regional VMT per employee for the proposed non-residential project type or resulting in a net increase in total VMT may be considered significant. Lead agencies, using more location-specific information, may develop their own more specific thresholds, which may include other land use types.
- Redevelopment projects: Where a project replaces existing VMT-generating land uses, if the replacement leads to a net overall decrease in VMT, the project would cause a less-than-

thresholds for those sections to help inform new thresholds exclusively for transportation purposes. Lead agencies should carefully consider how they value state goals for VMT/GHG reduction in light of other general plan and community objectives. Translating state goals into VMT thresholds should consider substantial evidence such as California Air Resources Board 2017 Scoping Plan - Identified VMT Reductions and Relationships to State Climate Goals, January 2019, CARB. Absent development of a specific VMT threshold, lead agencies may rely on those of other state agencies. The ARB thresholds are supported by substantial evidence related to state air quality and GHG goals, but do not consider recent VMT trends or the potential influence of emerging mobility options such as autonomous vehicles (AVs).

*\*\*The OPR and CARB thresholds do not consider the long-term influence of transportation network companies, internet shopping, new mobility options, or autonomous vehicles.*

significant transportation impact. If the project leads to a net overall increase in VMT, then the thresholds described above should apply.

#### **OPTION 2: SET THRESHOLDS CONSISTENT WITH THE GENERAL PLAN FUTURE YEAR VMT PROJECTIONS**

Set baseline VMT threshold based on long-term General Plan expectations for air quality and GHG emissions. The analysis to determine these thresholds would be completed if the Town Council selects this option. Example baseline thresholds are as follows.

- Land Use Projects:
  - Project Impact: A significant impact would occur if the VMT rate for the project would exceed a level of X% below the applicable baseline VMT rate.
  - Project Effect: A significant impact would occur if the project increases total (boundary) regional VMT compared to baseline conditions.
- Land Use Plans:
  - Project Impact: A significant impact would occur if the VMT rate for the plan area would exceed a level of X% below the applicable baseline VMT rate.

## **What is the VMT Impact Significance Threshold for Land Use Projects Under Cumulative Conditions?**

An impact under CEQA begins with a change to the existing environment, and therefore Existing (or Baseline) Conditions and Existing with Project Conditions must be evaluated. Because VMT will fluctuate with population and employment growth, changes in economic activity, and changes in travel modes including the expansion of new vehicle travel choices (i.e., the emergence of transportation network companies such as Uber and Lyft, autonomous vehicles, etc.), an impact analysis must also take into account the cumulative effects of the proposed project, these changes, and all other projects. Therefore, evaluations of Cumulative Conditions and Cumulative with Project Conditions are needed to identify potential cumulative impacts.

Pages 5 and 6 of the OPR *Technical Advisory* recommend considering a project's short-term, long-term, and cumulative effects on VMT. The first reference is on page 5 related to retail projects while the references on page 6 are for all projects (see excerpts below with most relevant portions underlined).

**Retail Projects.** Generally, lead agencies should analyze the effects of a retail project by assessing the change in total VMT<sup>11</sup> because retail projects typically re-route travel from other retail destinations. A retail project might lead to increases or decreases in VMT, depending on previously existing retail travel patterns. (Quote from page 5 of the *Technical Advisory on Evaluating Transportation Impacts in CEQA*, December 2018; footnote 11 in this quote is a reference to see Appendix 1 of the OPR *Technical Advisory*, which discusses evaluation of Total VMT – OPR is referring to boundary VMT.).

**Considerations for All Projects.** Lead agencies should not truncate any VMT analysis because of jurisdictional or other boundaries, for example, by failing to count the portion of a trip that falls outside the jurisdiction or by discounting the VMT from a trip that crosses a jurisdictional boundary. CEQA requires environmental analyses to reflect a "good faith effort at full disclosure." (CEQA Guidelines, § 15151.) Thus, where methodologies exist that can estimate the full extent of vehicle travel from a project, the lead agency should apply them to do so. Where those VMT effects will grow over time, analyses should consider both a project's short-term and long-term effects on VMT. (Quote from page 6 of the *Technical Advisory on Evaluating Transportation Impacts in CEQA*, December 2018).

**Cumulative Impacts.** A project's cumulative impacts are based on an assessment of whether the "incremental effects of an individual project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects." (Pub. Resources Code, § 21083, subd. (b)(2); see CEQA Guidelines, § 15064, subd. (h)(1).) (Quote from page 6 of the *Technical Advisory on Evaluating Transportation Impacts in CEQA*, December 2018).

The inclusion of project's effect for retail has raised the question about whether it would also be appropriate for other land uses. The importance of a complete analysis that considers the project's effect on VMT is because land use projects can influence the routing of existing trips and the VMT generation of surrounding land uses. Combined with the expectations established in the *CEQA Guidelines* and CEQA case law, ignoring the project's effect on VMT may not fully disclose the potential effects on the environment.

### Cumulative VMT Threshold Options

As noted earlier, a Cumulative VMT threshold should be able to evaluate both the direct, indirect, and cumulative effects of a project on VMT and consider uncertainty of VMT trends such as transportation network companies (TNCs), new mobility options, and autonomous vehicles (AVs). Below is a brief summary of three possible cumulative VMT threshold options:

- **Fair share of Regional VMT Allocation:** Use a regional model to analyze the “project’s effect on VMT” based on RTP/SCS consistency (projects should not increase the total project generated regional VMT forecast used to support the RTP/SCS air quality conformity and SB 375 GHG targets).
- **Cumulative VMT Thresholds is the same as Baseline VMT Threshold:** A lead agency can use the baseline VMT threshold (used for a Project Conditions evaluation of the project) if the baseline VMT efficiency metric is trending downward under Cumulative Conditions.
- **Long-Term Air-Quality and GHG Expectations:** Establish a VMT reduction threshold for Cumulative Conditions consistent with long-term air pollution and GHG reduction expectations.

All three of these options require knowledge of the forecasting tools available to test the Project’s effect on land use supply and VMT. Overall, the evaluation of the project’s effect on land use and VMT should use the most appropriate forecasting model and consider all substantial evidence including the California Air Resources Board *2017 Scoping Plan-Identified VMT Reductions and Relationships to State Climate Goals*, CARB and current research on the long-term effects of transportation network companies (TNCs), new mobility options, and autonomous vehicles (AVs). Any cumulative VMT forecasting should acknowledge that land use projects and plans typically do not influence regional land use control totals and that modeling scenarios should carefully consider the land use allocation between scenarios and/or the VMT metric used to establish the cumulative VMT threshold.

## CUMULATIVE VMT THRESHOLDS: OPTIONS, LIMITATIONS, AND CONSIDERATIONS

### COMMON OPTIONS

For analysis of cumulative VMT effects, the Town can choose from the following options:

1. Use a regional model to analyze the 'project's effect on VMT' based on RTP/SCS consistency (projects should not increase the total regional VMT (either total project generated or boundary VMT) forecast used to support the RTP/SCS air quality conformity and SB 375 GHG targets).
2. A lead agency can use the project analysis above if based on an efficiency metric form of VMT and evidence exists to demonstrate that cumulative trends in VMT rates are declining.
3. Establish a VMT reduction threshold for cumulative conditions consistent with long-term air pollution and GHG reduction expectations.

### COMMON LIMITATIONS

Uncertainty of VMT trends makes a cumulative impact finding less certain. Ability for a lead agency to identify the project's effect on land supply and corresponding VMT. Land use projects change land supply and the allocation of future population and employment growth. As such cumulative analysis should maintain the same control totals of regional population and employment growth. Requires knowledge of the forecasting tools available to test the project's effect on land supply and VMT.

### CONSIDERATIONS

Analyze the project's effect on land supply and VMT using an appropriate valid model. For impact findings, consider all available substantial evidence including 2018 Progress Report, California's Sustainable Communities and Climate Protection Act, November 2018, CARB and current research on the long-term effects of transportation network companies (TNCs), new mobility options, and autonomous vehicles (AVs). Specific research examples include Fehr & Peers AV effect model testing.

## CUMULATIVE VMT THRESHOLDS: TOWN OF LOS GATOS INITIAL RECOMMENDATIONS

### OPTION 1: RELY ON THE OPR TECHNICAL ADVISORY THRESHOLDS

OPR does not present cumulative thresholds. Analyze the project's effect on land supply and VMT using an appropriately valid travel model. For impact findings, consider all available substantial evidence including *California Air Resources Board 2017 Scoping Plan Identified VMT Reductions and Relationships to State Climate Goals*, January 2019, and current research on the long-term effects of transportation network companies (TNCs), new mobility options, and autonomous vehicles (AVs). The following are suggested cumulative thresholds.

- Land Use Projects:
  - Project Effect: A significant impact would occur if the project increases total regional VMT compared to cumulative no project conditions.
- Land Use Plans:
  - Project Effect: A significant impact would occur if growth in the plan area increases total VMT in the study area compared to cumulative no project conditions.
- Transportation Projects: A significant impact would occur if the project cause a net increase in total regional VMT compared to cumulative no project conditions.

All land use and transportation projects: A significant impact would occur if the project is inconsistent with the Regional Transportation Plan/Sustainable Community Strategy Plan (Plan Bay Area).

### OPTION 2: SET THRESHOLDS CONSISTENT WITH THE GENERAL PLAN FUTURE YEAR VMT PROJECTIONS

Use the same cumulative thresholds as Option 1.

## What is the VMT Impact Significance Threshold for Transportation Projects Under Baseline Conditions?

Transportation projects have the potential to change travel patterns and may lead to additional vehicle travel on the roadway network, also referenced as induced vehicle travel (OPR *Technical Advisory*, pp. 19-23, and Appendix 2). This is particularly true for roadway capacity expansion projects. Under *CEQA Guidelines* Section 15064.3(b)(2), lead agencies have the discretion to select their own metrics for all modes. Lead agencies can consider retaining current practices such as using LOS thresholds as identified in the General Plan but should evaluate whether use of LOS still complies with the new *CEQA Guidelines* expectations in Sections 15064.3, 15064, and 15064.7. Lead agencies that do not choose to use VMT to measure the impacts of transportation projects will still need to analyze VMT as an input to air quality, GHG, and energy impact analysis. For transportation projects that increase roadway capacity, the VMT estimates and forecasts will also need to include induced travel effects that lead agencies may not have included in past practice. However, not all roadway projects will lead to induced travel.

Project types that would likely lead to a measurable and substantial increase in vehicle travel generally include addition of through lanes on existing or new highways, including general purpose lanes, HOV lanes, peak period lanes, auxiliary lanes, or lanes through grade separated interchanges. OPR's *Technical Advisory* provides an extensive list of projects which are unlikely to lead to induced travel, including addition of roadway capacity on local or collector streets provided the project also substantially improves multimodal conditions. (OPR *Technical Advisory*, pp. 20-21.) Appendix 2 to OPR's *Technical Advisory* provides specific guidance on calculating induced vehicle travel.

Assuming VMT is used as the metric, transit (except for on-demand transit) and active transportation projects may be considered to have less than significant impact.

### **BASELINE TRANSPORTATION THRESHOLDS: OPTIONS, LIMITATIONS, AND CONSIDERATIONS**

#### **COMMON OPTIONS**

Lead agencies have discretion to choose their own metrics and thresholds for transportation project impact analysis. If VMT is selected, OPR recommends treating projects that reduce, or have no impact on, VMT to be presumed to have a less than significant impact.

#### **COMMON LIMITATIONS**

Continued use of LOS is uncertain because of *CEQA Guidelines* Section 15064.3(b)(2) and 15064.7(d)(2). Transit, especially on-demand transit service, can generate new VMT, which should be considered as part of impact conclusions.

#### **CONSIDERATIONS**

Consult *CEQA* legal advice about whether lead agency discretion allows continued use of LOS and whether VMT is required. VMT is required as an input to air quality, GHG, and energy impact analysis and should include induced vehicle travel effects.

**BASELINE TRANSPORTATION THRESHOLD: TOWN OF LOS GATOS INITIAL RECOMMENDATIONS**

**OPTION 1: RELY ON THE OPR *TECHNICAL ADVISORY* THRESHOLDS**

- Baseline Transportation Threshold: A significant impact would occur if a project causes a net increase in total regional VMT compared to baseline conditions or opening year no project conditions.
- Cumulative Transportation Threshold: A significant impact would occur if the project causes a net increase in total regional VMT compared to cumulative no project conditions.

**OPTION 2: SET THRESHOLDS CONSISTENT WITH THE GENERAL PLAN FUTURE YEAR VMT PROJECTIONS**

- Use the same cumulative thresholds as Option 1.

## Chapter 6. VMT Mitigation Actions

Lead agencies making the transition to VMT are realizing the challenges of trying to mitigate VMT on a project-by-project basis. Much of this difficulty arises from the regional nature of VMT impacts, as well as the complexity of underlying factors influencing VMT generation.

### Existing Programs

For large area plans such as general plans and specific plans, mitigation will typically focus on physical design elements related to the ultimate built environment, such as the density and mix of land uses as well as the availability and quality of the transportation network related to transit, walking, and bicycling.

For individual development projects, the primary methods of mitigating a VMT impact are to:

1. change the project in a way that reduces VMT; and/or
2. implement a program designed to reduce VMT, such as a Transportation Demand Management (TDM) program.

The available research indicates that the effectiveness of TDM measures varies substantially depending on the context in which they are applied. TDM is most effective in urban areas where urban character (land use and built environment) and land use mix are most supportive of vehicle trip reduction. TDM programs are less effective in rural and suburban areas where the built environment and transportation network are more dispersed and where modes are typically limited to personal vehicles.

The current standard for calculating VMT reduction efficacy from TDM strategies is the California Air Pollution Control Officer Association (CAPCOA) 2010 report *Quantifying Greenhouse Gas Mitigation Measures* ("CAPCOA report"). This resource evaluates the literature behind a number of TDM program elements, and provides methods for calculating a VMT reduction associated with each. There are several limitations in the available VMT reduction data for suburban and rural application that are worth noting here:

- **There is little to no evidence regarding the efficacy of TDM programs in rural areas.** For much of the hilly portions of Los Gatos, there may not be applicable programs with the level of evidence required to conclude that an impact can be reduced to less-than-significant levels.
- **Suburban areas have only moderate TDM options available for non-office land uses.** Overall, CAPCOA indicates that projects in suburban areas may be able to achieve up to a 15 percent reduction in VMT. However, achieving this level of reduction requires that the project either meet certain land use diversity and/or densities or adopts parking pricing, parking supply limits, or transit expansions—all of which may have a high financial or political cost.
- **Town-wide VMT reduction will be less than the sum of the individual TDM strategies implemented.** Each of the CAPCOA TDM strategies can be combined with others to increase the

effectiveness of VMT mitigation; however, the interaction between the various strategies is complex and sometimes counterintuitive. Generally, with each additional measure implemented, a VMT reduction is achieved, but the incremental benefit of VMT reduction may diminish.

- **TDM program effectiveness is highly dependent on individual tenants.** For office or retail TDM programs, the level of commitment by individual tenants determines the level of success. For most projects, the tenants will be unknown at the time of environmental review, and tenants can change frequently over the life of the building; this makes it more difficult to forecast TDM reductions.
- **TDM program implementation requires ongoing monitoring.** If used as a mitigation measure, TDM programs will require ongoing monitoring for compliance. This may require additional staff time on the part of the lead agency.

Due to the above considerations, it may be prudent to indicate that TDM programs may be used as project mitigation, but that they cannot on their own reduce a transportation impact to a less-than-significant level, unless stringent monitoring requirements are adopted as part of the mitigation.

## New VMT Mitigation Concepts

Today Los Gatos connects land development projects to transportation network improvements using a Traffic Impact Mitigation Fees program and the Congestion Management Program (CMP). The transportation impact fee program collects a fair-share fee payment from new development to contribute to the cost of a Total Mitigation Improvements Potential Project List consisting of long-term transportation projects that facilitate vehicle travel as the residential population and employment population increases. The CMP is designed to monitor traffic congestion and transit performance while implementing strategies that manage traffic congestion and its impacts on air quality. Los Gatos does include some TDM requirements for projects deemed to affect the CMP network; those projects must prepare a TDM plan meeting certain specifications to help reduce the number of vehicle trips.

Aside from the existing TDM requirements and funding of bicycle improvements, the Town transportation impact fee and CMP would not qualify as VMT impact mitigation programs because both programs are largely focused on vehicle capacity expansion or congestion management objectives. The current focus of both programs is to expand roadway capacity to address vehicle LOS deficiencies. This strategy may have the result of inducing new vehicle travel that, in the long run, would diminish congestion relief benefits and generate new VMT and emissions. Refer to the following websites for more research information and technical details.

- <https://ncst.ucdavis.edu/events/webinar-new-web-tool-calculate-induced-travel>
- [https://www.arb.ca.gov/cc/sb375/policies/hwycapacity/highway\\_capacity\\_brief.pdf](https://www.arb.ca.gov/cc/sb375/policies/hwycapacity/highway_capacity_brief.pdf)
- <https://trrjournalonline.trb.org/doi/abs/10.3141/2653-02>

Managing and reducing demand could accomplish the CMP goal especially by focusing on reducing peak period VMT. The main source of congestion as defined by the CMP is that vehicles move too slowly (i.e., peak period speeds are lower than posted speed limits). This definition of congestion describes a

symptom and fails to recognize that peak period travel consists of vehicles with poor seat utilization caused by not managing demand more effectively and mispricing travel. The existing roadway network in Los Gatos has a limited capacity and this capacity is routinely filled up during peak periods by vehicles with solo drivers (i.e., low seat utilization). Further, limited facilities exist that prioritize travel by high occupancy vehicles. Increasing vehicle speeds and reducing delays substantially requires much greater seat utilization in existing vehicles (i.e., private vehicles and public transit). This change would also reduce VMT. Hence, refocusing the CMP on the combination of congestion management and VMT reduction would result in a different Total Mitigation Improvements Potential Project List that could qualify as VMT impact mitigation.

Four possible mitigation approaches are described in the following sections:

- VMT Cap
- VMT Based Impact Fee Program
- VMT Mitigation Bank
- VMT Mitigation Exchange

A VMT Cap can be developed and administered on a project-by-project basis, while the remaining three options (VMT Based Impact Fee Program, VMT Mitigation Bank, and VMT Mitigation Exchange) are broader programmatic approaches to impact mitigation. The concept of a 'program' approach to impact mitigation is commonly used in a variety of technical subjects including transportation, air quality, GHG, and habitat. Absent new program-level VMT mitigation approaches, rural and suburban lead agencies will have limited feasible mitigation options for project sites. Without feasible mitigation, significant VMT impacts would be significant and unavoidable (SAU). Under these circumstances a project must prepare an environmental impact report (EIR) thus adding time and cost to environmental review compared to an initial study/negative declaration (IS/ND). Program-based approaches may be able to overcome the limitation of project-site only mitigation. Additional details about VMT fees, VMT banks and VMT exchanges including implementation flow charts is provided in **Appendix J**.

## **VMT Cap**

A VMT cap is a project specific limit on total project generated VMT. Often a VMT cap is linked to the jurisdiction's townwide/citywide air quality, GHG reduction, and energy conservation goals. VMT estimates are not directly observed – they must be estimated using big data sources, a travel survey, zip code data of residents, employees, customers or visitors, and/or a travel model. Like a vehicle trip cap, VMT caps often require a project applicant to implement a TDM program with monitoring and reporting standards. A VMT cap may also include specific consequences or penalties if the project fails to comply.

## **VMT Based Impact Fee Program**

Although establishing any impact fee program is time consuming, it is a common and well-understood process governed by the Mitigation Fee Act. Using a VMT reduction goal linked to the agency's SB 743 thresholds to establish the nexus would result in a Total Mitigation Improvements Potential Project List

consisting mostly of transit, bicycle, and pedestrian projects. These types of fee programs are recognized as an acceptable form of CEQA mitigation if they can demonstrate that the Total Mitigation Improvements Potential Project List will be fully funded and implemented.

### **VMT Mitigation Exchange**

A VMT Mitigation Exchange concept relies on a developer agreeing to implement a predetermined VMT-reducing project or proposing a new one, which could be located elsewhere in the community or possibly outside the community. The Exchange needs to have a facilitating entity that can match the VMT generator (the development project) with a VMT-reducing project or action. The facilitating entity could be the lead agency or another entity that has the ability to provide the match and to ensure through substantial evidence that the VMT reduction is valid. A key unknown with this approach is the time period for the VMT reduction. For example, how many years of VMT reduction would be required to declare a VMT impact less than significant?

### **VMT Mitigation Banks**

A VMT Mitigation Bank attempts to create a monetary value for VMT reduction such that a developer could purchase VMT reduction credits. The money exchanged for credits could be applied to local, regional, or state level VMT reduction projects or actions. Like all VMT mitigation, substantial evidence would be necessary to demonstrate that the projects covered by the Bank would achieve expected VMT reductions and some form of monitoring may be required. This is more complicated than a VMT Mitigation Exchange and would require more time and effort to set up and implement. The verification of how much VMT reduction is associated with each dollar or credit would be one of the more difficult parts of the program.

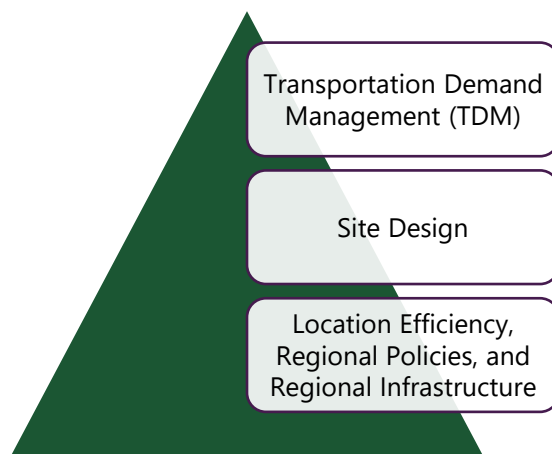

## **What VMT Reduction Mitigation Strategies are Feasible?**

An important consideration for the mitigation effectiveness is the scale for TDM strategy implementation. The biggest effects of TDM strategies on VMT (and resultant emissions) derive from regional policies related to land use location efficiency and infrastructure investments that support transit, walking, and bicycling. While there are many measures that can influence VMT and emissions that relate to site design and building operations, they have smaller effects that are often dependent on final building tenants.

**Figure 2** presents a conceptual illustration of the relative importance of scale.

Figure 3: Transportation-Related GHG Reduction Measures

Of the 50 transportation measures presented in the CAPCOA report, 41 are applicable at building and site level (see **Appendix K** for more information). The remaining nine are functions of, or depend on, site location and/or actions by local and regional agencies or funders. **Table 2** summarizes the strategies according to the scope of implementation and the agents who would implement them.

**Table 2: Summary of Transportation-Related CAPCOA Measures**

Scope	Agents	CAPCOA Strategies
Transportation Demand Management (TDM)	Employer, Manager	<b>26 total</b> from five CAPCOA strategy groups: <ul style="list-style-type: none"> <li>• <b>3</b> from 3.2 Site Enhancements group</li> <li>• <b>3</b> from 3.3 Parking Pricing Availability group</li> <li>• <b>15</b> from 3.4 Commute Trip Reduction group</li> <li>• <b>2</b> from 3.5 Transit Access group</li> <li>• <b>3</b> from 3.7 Vehicle Operations group</li> </ul>
Site Design	Owner, Architect	<b>15 total</b> from three strategy groups: <ul style="list-style-type: none"> <li>• <b>6</b> from 3.1 Land Use group</li> <li>• <b>6</b> from 3.2 Site Enhancements group</li> <li>• <b>1</b> from 3.3 Parking group</li> <li>• <b>2</b> from 3.6 Road Access group</li> </ul>
Location Efficiency, Regional Policies, and Regional Infrastructure	Developer, Regional and Local Agencies	<b>6 total</b> from 3.1 Land Use group

Note: Disruptive trends, including but not limited to, transportation network companies (TNCs), autonomous vehicles (AVs), internet shopping, and micro-transit may affect the future effectiveness of these strategies.  
Source: Fehr & Peers, 2020

Of these strategies, only a few are likely to be effective in a suburban setting such as Los Gatos. The following list of strategies were identified for more detailed review based on how the land use context, and potential land use changes, in Los Gatos could influence each strategy's effectiveness.

## Transportation Demand Management (TDM)

1. Encourage telecommuting and alternative work schedules: This strategy relies on effective internet access and speeds to individual project sites/buildings to provide the opportunity for telecommuting. The effectiveness of the strategy depends on the ultimate building tenants and this should be a factor in considering the potential VMT reduction.
2. Provide ride-sharing programs: This strategy focuses on encouraging carpooling and vanpooling by project site/building tenants and has similar limitations as strategy 1 above.
3. Provide local shuttle service: This strategy focuses on providing local shuttle service. The local shuttles would provide service to transit hubs, schools, commercial centers, and residential areas to improve transit connectivity and address the “first/last mile” problems. Alternatively, a demand-responsive service could be provided as subsidized trips by contracting to private TNCs or taxi companies. Note that implementation of this strategy would require regional or local agency implementation.
4. Provide employer-sponsored vanpools or shuttles: This strategy relies on employers purchasing or leasing vans or shuttles, and often subsidizing the cost of at least program administration, if not more. Vanpools typically service employee’s commute to work, while shuttles service nearby transit stations and surrounding commercial centers. Scheduling and rider charges (if any) are within the employer’s purview.

## Site Design

5. Provide pedestrian network improvements: This strategy focuses on creating a pedestrian network within the project and connecting to nearby destinations. Projects in Los Gatos tend to be smaller so the emphasis of this strategy would likely be the construction of network improvements that connect the project site directly to nearby destinations. Alternatively, implementation could occur through an impact fee program or benefit/assessment district based on regional or local plans such as the Bicycle and Pedestrian Master Plan.
6. Provide traffic calming measures and low-stress bicycle network improvements: This strategy combines the CAPCOA research focused on traffic calming with new research on providing a low-stress bicycle network. Traffic calming creates networks with low vehicle speeds and volumes that are more conducive to walking and bicycling. Building a low-stress bicycle network produces a similar outcome. Implementation options are similar to strategy 3 above. One potential change in this strategy over time is that e-bikes (and e-scooters) could extend the effective range of travel on the bicycle network, which could enhance the effectiveness of this strategy.
7. Implement car-sharing program: This strategy reduces the need to own a vehicle or reduces the number of vehicles owned by a household by making it convenient to access a shared vehicle for those trips where vehicle use is essential. Examples include programs like ZipCar, Car2Go, and Gig.
8. Limit parking supply: When combined with companion TDM measures, reduced parking supply discourages driving by limiting easy and convenient parking options. Implementation of this strategy may require reducing (or removing) minimum parking requirements and allowing developers to use shared parking strategies.
9. Unbundle parking costs from property cost: Unbundling separates parking costs from property cost, for instance by not including a parking space in a residential unit’s rent, or by requiring

employers to lease each parking space separately from the building owner. This strategy ensures that the user understands that the cost of driving includes parking and can encourage people to use an alternative mode to save money.

10. On-street market pricing for parking: This strategy focuses on implementing a pricing strategy for parking by pricing all on-street parking in central business districts, employment centers, and retail centers. Priced parking would encourage “park once” behavior and may also result in area-wide mode shifts.

### **Location Efficiency, Regional Policies, and Regional Infrastructure**

11. Increase density of land uses: This strategy focuses on increasing density of land uses, where allowed by the General Plan and/or Zoning Ordinance, to reduce distances people travel and provide more travel mode options. This strategy also provides a foundation for many other strategies. For example, densification increases transit ridership, which justifies enhanced transit service.
12. Increase diversity of land uses: This strategy focuses on inclusion of mixed uses within projects or in consideration of the surrounding area to minimize vehicle travel in terms of both the number of trips and the length of those trips.
13. Increase transit accessibility: This strategy focuses on encouraging the use of transit by locating a project with high density near transit. A project with a residential/commercial center designed around a bus station is referred to as a transit-oriented development (TOD).
14. Integrate affordable and below market rate (BMR) housing: This strategy provides greater opportunities for lower income families to live closer to job centers since income effects probability that a commute will take transit or walk to work.
15. Increase transit service frequency and speed: This strategy focuses on improving transit service convenience and travel time competitiveness with driving. Given existing land use density in Los Gatos, this strategy may be limited to traditional commuter transit where trips can be pooled at the start and end locations, or it may require new forms of demand-responsive transit service. Note that implementation of this strategy would require regional or local agency implementation, substantial changes to current transit practices, and would not likely be applicable for individual development projects.
16. Implement area or cordon pricing: This strategy focuses on implementing a cordon (i.e., boundary) pricing scheme, where a cordon is set around a specific area to charge a toll to enter the area by vehicle. The cordon location is usually the boundary of an area with limited points of access. The cordon toll may be constant, applied during peak periods, or be variable, with higher prices during congestion peak periods. The toll can also be based on a fixed schedule or be dynamic, responding to real-time congestion levels. Note that implementation of this strategy requires alternative modes of travel that are available and reliable, such as high-quality transit infrastructure.

### **Summary of Mitigation Action Options**

**Table 3** presents the three groups of VMT mitigation actions discussed above, and presents the potential reduction from utilizing strategies in each group. Individual VMT strategies range widely in effectiveness,

as discussed above; therefore, **Table 3** summarizes an approximate range of VMT reductions by strategy group.

Table 3: Summary of VMT Mitigation Action Options		
Scope	VMT Reduction Ranges	
	Low <sup>1</sup>	High <sup>2</sup>
Transportation Demand Management (TDM)	0%	6%
Site Design	3%	10%
Location Efficiency, Regional Policies, and Regional Infrastructure	20%	60%

Notes:

1. Low/"Typical" indicates a conservative estimate that is highly defensible and suitable for use in environmental analysis documents, or to mitigate a VMT impact. Not all strategies provide a quantifiable reduction suitable for EIR/EIS use.
2. High/"Ambitions" indicates a potential upper limit to reductions, and requires a very high level of investment in most cases.
3. Please note that disruptive trends, including but not limited to, transportation network companies (TNCs), autonomous vehicles (AVs), internet shopping, and micro-transit may affect the future effectiveness of these strategies.

Source: Fehr & Peers, 2020

Overall, CAPCOA indicates that projects in suburban areas may be able to achieve up to a 15 percent reduction in VMT. However, achieving this level of reduction requires that the project implement many individual project-level strategies (such as TDM and Site Design strategies) *and* be sited in an efficient, transit-adjacent location. These traits may not be feasible for many future projects in Los Gatos. In addition, project-level TDM strategies are often implemented by individual building tenants (i.e., employers), so their use requires on-going monitoring and adjusting to account for changes in tenants and their travel behavior.

Due to these project-specific implementation barriers, ad-hoc project-by-project mitigation is less effective for reducing VMT compared with larger scale program-based approaches such as an impact fee program. The emergence of these new mitigation concepts presents opportunities to reduce VMT at a townwide/citywide or regionwide scale, though the measured effects of these programs (and their ability to reach desired long-term land use outcomes) are largely unknown.

## VMT MITIGATION: OPTIONS, LIMITATIONS, AND CONSIDERATIONS

### COMMON OPTIONS

Menu of built environment and transportation demand management (TDM) mitigation strategies contained in Quantifying Greenhouse Gas Mitigation Strategies, CAPCOA, 2010.

### COMMON LIMITATIONS

Built environment strategies require modifying the project, which may create inconsistencies with the project description and financial feasibility. TDM strategies are often building tenant dependent so their use requires on-going monitoring and adjusting to account for changes in build tenants and their travel behavior.

Ad-hoc project-by-project mitigation is less effective for reducing VMT than larger scale program-based approaches such as an impact fee program.

### CONSIDERATIONS

Develop a VMT mitigation program using any of the following approaches.

1. Impact fee program based on a VMT reduction nexus.
2. In-lieu fee program for VMT reducing actions.
3. VMT mitigation bank or exchange program.
4. TDM ordinance applying to all employers.

# Chapter 7. Additional Implementation Considerations

The previous chapters focus on the necessary policy decisions required for the Town to be in compliance with SB 743. This chapter discusses some of the more practical effects and considerations of this statutory change including: how communities can continue to use vehicular level of service in their planning processes, use of tiering, and how responsibilities of commenting agencies on other agencies' EIRs have not changed.

## Retaining LOS and Other Performance Metrics

While SB 743 removes vehicle delay from the assessment of environmental concerns, it continues to allow lead agencies to set standards and acceptability thresholds for local roadways as part of their General Plan and Transportation Element. Should the Town wish to retain vehicle LOS as an important part of its development review process, vehicle delay and traffic concerns would be addressed during the entitlements / development application process rather than as an environmental concern. From an environmental perspective, substantial evidence would need to be presented that shows how the use of LOS does not induce additional vehicle travel. Specifically, if the Transportation Element of the General Plan includes an LOS-based standard, the environmental analysis of the General Plan may find a significant impact to VMT, because such a standard would likely require roadway capacity improvements that increase total project generated VMT in the Town. Because of these conflicts, it may be useful to focus on detailed VMT analysis for larger land use plans as a way of permitting additional streamlining for pursuant tiered environmental review efforts. The Town may also consider adding a policy in the Mobility Element of the General Plan to clarify the approach for balancing the needs of all roadway users if roadway capacity improvements conflict with the VMT policies.

## Projects Consistent with a Community Plan or Zoning

As discussed in **Appendix F**, another consideration in threshold setting is how to address cumulative VMT impacts and whether addressing them in the general plan EIR is advantageous for streamlining the review of subsequent land use and transportation projects given CEQA relief available through *CEQA Guidelines* Section 15183. This section relieves a project of additional environmental review if the environmental impact was adequately addressed in the general plan EIR and the project is consistent with the general plan (see below).

*15183. PROJECTS CONSISTENT WITH A COMMUNITY PLAN OR ZONING*

*(a) CEQA mandates that projects which are consistent with the development density established by existing zoning, community plan, or general plan policies for which an EIR was certified shall not require additional environmental review, except as might be necessary to examine whether there*

*are project-specific significant effects which are peculiar to the project or its site. This streamlines the review of such projects and reduces the need to prepare repetitive environmental studies.*

The use of Section 15183 also addresses cumulative impacts as acknowledged in Section 15130(e).

*15130. DISCUSSION OF CUMULATIVE IMPACTS*

*(e) If a cumulative impact was adequately addressed in a prior EIR for a community plan, zoning action, or general plan, and the project is consistent with that plan or action, then an EIR for such a project should not further analyze that cumulative impact, as provided in Section 15183(j).*

For the Town of Los Gatos, addressing transportation VMT impacts in the Town General Plan EIR could be useful in understanding how VMT reduction should be balanced against other community values when it comes to setting new VMT impact thresholds for SB 743.

## **Reviewing Projects in Neighboring Jurisdictions**

Many of the roads in the Town serve vehicle traffic from neighboring jurisdictions and it is expected that many new land use projects that add future traffic to the Town roads will be entitled in other jurisdictions. As a reviewing agency, the Town is concerned about how new trips from a neighboring jurisdiction will affect its transportation network. Historically, a neighboring lead agency would use the Town's level of service policy to identify future operational problems on Town roads, identify potential impacts and mitigation, and if possible, arrange for the project sponsor to pay a fair-share toward future transportation improvements. Lead agencies are realizing that using VMT as a metric makes it difficult to identify location-specific impacts within its jurisdiction or in a neighboring jurisdiction. The concept of a 'program' approach to impact mitigation (as discussed in the previous chapter) can be an attractive solution. Under a program-based approach, development mitigation contributions could be pooled to pay for VMT reduction strategies that would not be feasible for individual projects to implement, and if the program is multi-jurisdictional (as VMT itself is), it could address VMT impacts in multiple jurisdictions.

As a commenting agency, the Town of Los Gatos will retain its right to review EIRs from neighboring jurisdictions for consistency, completeness, and accuracy, and may submit comments which will be included in the lead agency's Response to Comments. Changes to CEQA statute also continue to require an EIR to review the potential environmental impacts of a project even if those impacts occur outside of the lead agency's jurisdiction. This applies to all EIR categories; as such, projects reviewed by neighboring communities would still be required to consider air quality, GHG emissions, shadows, historic resources, and all other CEQA sections for impacts. The Town may comment on these determinations at any of the CEQA designated review points.

# Appendix A: Summary Matrix of Decisions, Options, and Recommendations

Summary of SB 743 Decisions, Options, and Recommendations

Lead Agency Decisions	Common Options	Common Limitations	Considerations	Town of Los Gatos Initial Recommendations
What form of VMT metrics could be used?	<div><div>1.</div><div>Total Project Generated VMT</div></div> <div><div>2.</div><div>Total Project Generated VMT per Service Population<sup>1</sup></div></div> <div><div>3.</div><div>Household generated VMT per Resident (requires an activity/tour-based travel forecasting model)</div></div> <div><div>4.</div><div>Home-Based VMT per Resident (a partial VMT estimate)</div></div> <div><div>5.</div><div>Home-Based Work VMT per Employee (a partial VMT estimate)</div></div> <div><div>6.</div><div>Project’s Effect on VMT using Boundary VMT for a specific area</div></div>	Metrics other than total project generated VMT and total project generated VMT per service population typically only represent partial VMT (i.e., some vehicle types and trip purposes are excluded in the models used to estimate VMT). The use of partial VMT may be beneficial for baseline screening of smaller projects, but for larger and more complex projects total VMT may be needed for a complete VMT impact analysis. Project-generated VMT metrics cannot capture how a project changes behavior of non-project residents or employees.	Total VMT metrics include all types of VMT (i.e., visitor trips, medium-duty and heavy-duty vehicles, public transit buses, and other types of vehicle miles that might not be captured in the most common partial VMT metrics) captured by a travel forecasting model, regardless of the type of vehicle or the trip’s purpose. Partial VMT refers to the use of only particular trip purposes and/or vehicle types for assessing a project’s impacts. The expectations of a CEQA impact analysis to strive to provide a complete picture of the effects of a project on the environment are highlighted within the <i>CEQA Guidelines</i> . For lead agencies, VMT metrics and method should consider current practice for air quality, greenhouse gases (GHG), and energy consumption impact analysis. In general, VMT is used as an input for these other analyses and current practice is to produce VMT estimates and forecasts that comply with <i>CEQA Guidelines</i> expectations.	<div><b>Option 1: Rely on the OPR <i>Technical Advisory Thresholds</i></b> Include the following so that all forms of VMT needed for project screening and complete VMT analysis are available:<ul style="list-style-type: none"><li>Total Project Generated VMT</li><li>Total Project Generated VMT per Service Population</li><li>Home-Based VMT per Resident</li><li>Home-Based Work VMT per Employee</li><li>Boundary VMT for an appropriate area affected by the Project (needed for air quality, GHG, and energy analysis)</li></ul></div> <div><b>Option 2: Set Thresholds Consistent with the General Plan <i>Future Year VMT Projections</i></b> Include the following so that forms of VMT needed for a complete VMT analysis are available:<ul style="list-style-type: none"><li>Total Project Generated VMT</li><li>Total Project Generated VMT per Service Population</li><li>Boundary VMT for an appropriate area affected by the Project (needed for air quality, GHG, and energy analysis)</li></ul></div>
What methods are available to use in estimating and forecasting VMT?	<div><div>1.</div><div>Caltrans Statewide Travel Demand Model</div></div> <div><div>2.</div><div>Metropolitan Transportation Commission (MTC) Regional Travel Forecasting Model</div></div> <div><div>3.</div><div>VTA-C/CAG Bi-County Travel Forecasting Model</div></div> <div><div>4.</div><div>Local Town of Los Gatos Travel Forecasting Model (not currently available)</div></div> <div><div>5.</div><div>Non-model “Accounting Methods” such as sketch planning tool or spreadsheet<sup>2</sup></div></div>	Statewide and regional models have limited sensitivity and accuracy for local scale applications off the shelf. Regional and local models often truncate trips at model boundaries. Sketch and spreadsheet tools do not capture the ‘project effect on VMT’.	Selection of an appropriate travel forecasting approach is an important step because the tool used to develop VMT thresholds must also be used to evaluate a project’s direct and cumulative VMT impacts. Regional or local models should be calibrated and validated for local project-scale sensitivity/accuracy (including appending trip length data for trips with external trip ends) before using these models to analyze both ‘project generated VMT’ and ‘project effect on VMT’.	<div><b>Option 1: Rely on the OPR <i>Technical Advisory Thresholds</i></b> Use the Santa Clara Countywide VMT Evaluation Tool for baseline VMT screening, And most likely the VTA-C/CAG Bi-County Travel Forecasting Model, Local Town of Los Gatos Travel Forecasting Model (not currently available), or Non-model “Accounting Methods” such as sketch planning tool or spreadsheet.</div> <div><b>Option 2: Set Thresholds Consistent with the General Plan <i>Future Year VMT Projections</i></b> Most likely the VTA-C/CAG Bi-County Travel Forecasting Model, Local Town of Los Gatos Travel Forecasting Model (not currently available), or Non-model “Accounting Methods” such as sketch planning tool or spreadsheet.</div>

<sup>1</sup> Service population includes population plus employment and may include students or visitors; it is intended to include all independent variables used in estimating trips.

<sup>2</sup> Sketch planning tool or spreadsheet method has limitations if using a townwide/citywide or regional average for a threshold.

Summary of SB 743 Decisions, Options, and Recommendations

Lead Agency Decisions	Common Options	Common Limitations	Considerations	Town of Los Gatos Initial Recommendations
<b>Is use of VMT impact screening desired?</b> <sup>3</sup>	<p>Projects that reduce VMT or are located within transit priority areas (TPAs) should be presumed to have a less than significant impact on VMT. Additional screening options identified in the OPR <i>Technical Advisory</i> for:</p> <ol style="list-style-type: none"><li>Map based screening for residential and office projects</li><li>Local-Serving Retail Projects</li><li>Transportation projects that do not add vehicle capacity</li><li>Projects that would not result in a net increase of VMT</li><li>Affordable housing projects</li><li>Small projects</li></ol>	<p>Screening does not provide information about the actual VMT changes associated with the project.</p>	<p>Screening most appropriate if consistent with applicable general plan and supported by substantial evidence.</p>	<p><b><u>Option 1: Rely on the OPR <i>Technical Advisory</i> Thresholds</u></b> Rely on screening if consistent with applicable general plan and supported by substantial evidence demonstrating cumulative VMT is declining. For project-by-project VMT analysis with VMT screening, most projects will likely not screen out, which will require a more complete VMT analysis.</p> <p>Apply screening for the following project types:</p> <ul style="list-style-type: none"><li>Small Developments</li><li>Projects in Low-VMT Areas</li><li>Projects in Proximity to Major Transit Stops</li><li>Affordable Housing</li><li>Local-Serving Retail Projects less than 10,000 square feet</li><li>Transportation Projects that do not add vehicle capacity</li></ul> <p>The Santa Clara Countywide VMT Estimation Tool will be applied for screening as follows:</p> <ul style="list-style-type: none"><li>Low VMT generation map-based screening of residential, office, and industrial land uses, those land uses in combination with each other, and those land uses with or without local serving retail space.</li><li>A transit priority areas (TPAs)/major transit stops and high-quality transit corridor (HQTC) screen.</li></ul> <p><b><u>Option 2: Set Thresholds Consistent with the General Plan Future Year VMT Projections</u></b> Screening not used for this approach. Rather than analyzing VMT for each proposed land use project individually, projects consistent with the General Plan could be exempt from further VMT impact analysis since VMT impacts would have been analyzed in the General Plan EIR.</p>
<b>What is the VMT impact significance threshold for land use projects under baseline conditions?</b>	<ol style="list-style-type: none"><li>Lead agency discretion consistent with general plan and expectations for ‘project scale’ VMT reductions not accounted for in general plan EIR and supported by substantial evidence.</li><li>OPR 15% below baseline average a town/city or region (light-duty vehicles only)<sup>4</sup></li><li>CARB 14.3% below baseline (2018) average of jurisdiction (all vehicles)</li></ol>	<p>Difficult for lead agencies to determine what level of VMT change is unacceptable when viewed solely through a transportation lens. Uncertainty of VMT trends contributes to difficulty in setting thresholds. Connecting a VMT reduction expectation to baseline helps to reduce uncertainty associated with future conditions.</p>	<p>Since VMT is already used in air quality, GHG, and energy impact analysis, lead agencies should review thresholds for those sections to help inform new thresholds exclusively for transportation purposes.</p> <p>Lead agencies should carefully consider how they value state goals for VMT/GHG reduction in light of other general plan and community objectives. Translating state goals into VMT thresholds should consider substantial evidence such as <i>California Air Resources Board 2017 Scoping Plan - Identified VMT Reductions and Relationships to State Climate Goals</i>, January 2019, CARB.</p>	<p><b><u>Option 1: Rely on the OPR <i>Technical Advisory</i> Thresholds</u></b> Specific VMT thresholds for residential, office (work-related), and retail land uses from the OPR Technical Advisory are summarized below.</p> <ul style="list-style-type: none"><li><u>Residential projects</u>: A proposed project exceeding a level of 15 percent below existing (baseline) VMT per capita may indicate a significant transportation impact. Existing VMT per capita may be measured as regional VMT per capita, a townwide VMT per capita, or as geographic sub-area VMT per capita.</li><li><u>Office projects</u>: A proposed project exceeding a level of 15 percent below existing (baseline) regional VMT per employee may indicate a significant transportation impact.</li></ul>

<sup>3</sup> CEQA Guidelines Section 15064.3 states that projects that would reduce VMT or are located in a TPA should be presumed to have a less than significant impact on VMT. The OPR *Technical Advisory* contains other potential screening options.

<sup>4</sup> The OPR and CARB thresholds do not consider the long-term influence of TNCs, internet shopping, new mobility options, or autonomous vehicles.

# Summary of SB 743 Decisions, Options, and Recommendations

Lead Agency Decisions	Common Options	Common Limitations	Considerations	Town of Los Gatos Initial Recommendations
	<div>4. CARB 16.8% below baseline (2018) average of jurisdiction (light-duty vehicles only)</div> <div>5. Pending Caltrans-recommended threshold (net zero VMT)<sup>5</sup></div>		Absent development of a specific VMT threshold, lead agencies may rely on those of other state agencies. The CARB thresholds are supported by substantial evidence related to state air quality and GHG goals, but do not consider recent VMT trends or the potential influence of emerging mobility options such as autonomous vehicles (AVs).	<div><div><div>• <u>Retail projects</u>: A net increase in total (boundary) VMT may indicate a significant transportation impact.</div><div>• <u>Mixed-use projects</u>: Lead agencies can evaluate each component of a mixed-use project independently and apply the significance threshold for each project type included (e.g., residential and retail). Alternatively, a lead agency may consider only the project’s dominant use. In the analysis of each use, a project should take credit for internal capture.</div><div>• <u>Other non-residential project types</u>: OPR recommends using the quantified thresholds above, thus a proposed project exceeding a level of 15 percent below existing regional VMT per employee for the proposed non-residential project type or resulting in a net increase in total VMT may be considered significant. Lead agencies, using more location-specific information, may develop their own more specific thresholds, which may include other land use types.</div><div>• <u>Redevelopment projects</u>: Where a project replaces existing VMT-generating land uses, the OPR <i>Technical Advisory</i> recommends that if the replacement leads to a net overall decrease in VMT, the project would lead to a less-than-significant transportation impact. If the project leads to a net overall increase in VMT, then the thresholds described above should apply.</div></div><div><div><b>Option 2: Set Thresholds Consistent with the General Plan Future Year VMT Projections</b></div><div>Set baseline VMT threshold based on long-term General Plan expectations for air quality and GHG emissions. The analysis to determine these thresholds would be completed if the Town Council selects this option. Example baseline thresholds are as follows.</div><div><div>• Land Use Projects:<div><div>• Project Impact: A significant impact would occur if the VMT rate for the project would exceed a level of X% below the applicable baseline VMT rate.</div><div>• Project Effect: A significant impact would occur if the project increases total (boundary) regional VMT compared to baseline conditions.</div></div></div><div>• Land Use Plans:<div>• Project Impact: A significant impact would occur if the VMT rate for the plan area would exceed a level of X% below the applicable baseline VMT rate.</div></div></div></div></div>

<sup>5</sup> Caltrans has released draft Interim Guidance on “*Determining CEQA Significance for GHG Emissions for Projects on the State Highway System*” that recommends that any increase in GHG emissions would constitute a significant impact. This has been referred to as the “Net Zero VMT threshold”. Caltrans has thus far signaled that this threshold would be applied only to transportation projects.

Summary of SB 743 Decisions, Options, and Recommendations

Lead Agency Decisions	Common Options	Common Limitations	Considerations	Town of Los Gatos Initial Recommendations
<b>What is the VMT impact significance threshold for land use projects under cumulative conditions?</b>	<div><div>1.</div><div>Use a regional model to analyze the ‘project’s effect on VMT’ based on RTP/SCS consistency [projects should not increase the total regional VMT (either project generated or boundary VMT) forecast used to support the RTP/SCS air quality conformity and SB 375 GHG targets].</div></div> <div><div>2.</div><div>A lead agency can use the project analysis above if based on an efficiency metric form of VMT and evidence exists to demonstrate that cumulative trends in VMT rates are declining.</div></div> <div><div>3.</div><div>Establish a VMT reduction threshold for cumulative conditions consistent with long-term air pollution and GHG reduction expectations.</div></div>	<p>Uncertainty of VMT trends makes a cumulative impact finding less certain.</p> <p>Ability for a lead agency to identify the project’s effect on land supply and corresponding VMT.</p> <p>Land use projects change land supply and the allocation of future population and employment growth. As such cumulative analysis should maintain the same control totals of regional population and employment growth.</p> <p>Requires knowledge of the forecasting tools available to test the project’s effect on land supply and VMT.</p>	<p>Analyze the project’s effect on land supply and VMT using an appropriate valid model. For impact findings, consider all available substantial evidence including <i>2018 Progress Report, California’s Sustainable Communities and Climate Protection Act</i>, November 2018, CARB and current research on the long-term effects of transportation network companies (TNCs), new mobility options, and autonomous vehicles (AVs). Specific research examples include Fehr &amp; Peers AV effect model testing.</p>	<p><b><u>Option 1: Rely on the OPR Technical Advisory Thresholds</u></b></p> <p>OPR does not present cumulative thresholds. Analyze the project’s effect on land supply and VMT using an appropriately valid travel model. For impact findings, consider all available substantial evidence including <i>California Air Resources Board 2017 Scoping Plan Identified VMT Reductions and Relationships to State Climate Goals</i>, January 2019, and current research on the long-term effects of transportation network companies (TNCs), new mobility options, and autonomous vehicles (AVs). <b>What is the VMT impact significant threshold for transportation projects under baseline conditions?</b>	<p>Lead agencies have discretion to choose their own metrics and thresholds for transportation project impact analysis. If VMT is selected, OPR recommends treating projects that reduce, or have no impact on, VMT to be presumed to have a less than significant impact.</p>	<p>Continued use of LOS is uncertain because of CEQA Guidelines Section 15064.3(b)(2) and 15064.7(d)(2).</p> <p>Transit, especially on-demand transit service, can generate new VMT, which should be considered as part of impact conclusions.</p>	<p>Consult CEQA legal advice about whether lead agency discretion allows continued use of LOS and whether VMT is required. VMT is required as an input to air quality, GHG, and energy impact analysis and should include induced vehicle travel effects.</p>	<p><b><u>Option 1: Rely on the OPR Technical Advisory Thresholds</u></b></p> <div><div><div>•</div><div>Baseline Transportation Threshold: A significant impact would occur if a project causes a net increase in total regional VMT compared to baseline conditions or opening year no project conditions.</div></div><div><div>•</div><div>Cumulative Transportation Threshold: A significant impact would occur if the project causes a net increase in total regional VMT compared to cumulative no project conditions.</div></div></div> <p><b><u>Option 2: Set Thresholds Consistent with the General Plan Future Year VMT Projections</u></b></p> <p>Use the same cumulative thresholds as Option 1.</p>

# Summary of SB 743 Decisions, Options, and Recommendations

Lead Agency Decisions	Common Options	Common Limitations	Considerations	Town of Los Gatos Initial Recommendations
What VMT reduction mitigation strategies are feasible?	Menu of built environment and transportation demand management (TDM) mitigation strategies contained in Quantifying Greenhouse Gas Mitigation Strategies, CAPCOA, 2010.	Built environment strategies require modifying the project, which may create inconsistencies with the project description and financial feasibility. TDM strategies are often building tenant dependent so their use requires on-going monitoring and adjusting to account for changes in build tenants and their travel behavior. Ad-hoc project-by-project mitigation is less effective for reducing VMT than larger scale program-based approaches such as an impact fee program.	Develop a VMT mitigation program using any of the following approaches.  1. Impact fee program based on a VMT reduction nexus.  2. In-lieu fee program for VMT reducing actions.  3. VMT mitigation bank or exchange program.  4. TDM ordinance applying to all employers.	<b>Option 1: Rely on the OPR <i>Technical Advisory</i> Thresholds</b> Lead agencies have the discretion to select mitigation measures and alternatives to reduce VMT. Ad-hoc project-by-project mitigation is less effective for reducing VMT than larger scale program-based approaches such as an impact fee program.  <b>Option 2: Set Thresholds Consistent with the General Plan Future Year VMT Projections</b> Lead agencies have the discretion to select mitigation measures and alternatives to reduce VMT. Ad-hoc project-by-project mitigation is less effective for reducing VMT than larger scale program-based approaches such as an impact fee program.

# Appendix B: Comparison of Available Travel Forecasting Models

# Memorandum

Date: January 23, 2020  
To: Ying Smith, Town of Los Gatos  
From: Charlie Coles, Dan Rubins and Matt Haynes  
Subject: **Comparison of Available Travel Forecasting Models for Town of Los Gatos**

SJ19-1964

## Comparison of Available Travel Forecasting Models for Town of Los Gatos

There are two types of travel forecasting models: activity-based (also called tour-based) models, such as the Metropolitan Transportation Commission (MTC) travel forecasting model ("MTC Model"), and trip-based models such as the Santa Clara Valley Transportation Authority (VTA) travel forecasting model ("VTA Model"). Either type of model can be used to develop VMT forecasts.<sup>1</sup> The *Technical Advisory* specifies that the VMT evaluation should ideally capture the full length of the trips being analyzed and should not truncate those trips at jurisdictional or model boundaries.

The two travel forecasting models available for the purposes of VMT analysis in Los Gatos are the:

- MTC travel forecasting model
- VTA travel forecasting model

Both models cover the entire nine-county Bay Area region. The MTC travel forecast model is produced largely to comply with federal and state laws related to preparing regional transportation plans (RTPs), air quality conformity, and greenhouse gas (GHG) analysis for sustainable communities strategies (SCS). The MTC Model is an activity-based (or tour-based) model, meaning it can track VMT separately for different categories of people (residents, workers, students). Our investigations and applications of the MTC travel forecasting model have revealed

---

<sup>1</sup> Also considered was the Caltrans Statewide Travel Demand Model and sketch planning tools or spreadsheets. But the Caltrans travel forecasting model is meant for statewide analysis and non-model "accounting methods" such as sketch planning tools or spreadsheets. The former does not have enough detail in the travel forecasting model to be applied in the Town of Los Gatos. The latter has limitations when considering citywide, countywide, or regionwide VMT thresholds.

the use of input parameters that are not reasonably foreseeable such as land use growth allocations inconsistent with local general plans, substantial increases in telecommuting or other TDM strategies, and implementation of travel pricing.

The VTA Model includes a more detailed representation of the Santa Clara and San Mateo counties transportation network and land use patterns and is the model that has traditionally been used for most project-specific applications in Santa Clara County jurisdictions. The VTA Model is a trip-based model, which means it is difficult to separately measure the VMT generated by residents and workers. Like the MTC travel forecasting model, the VTA travel forecasting model often needs refinement to be applied at a local jurisdiction level like in the Town of Los Gatos.

Additional detail is summarized below for the MTC and VTA travel forecasting models based on Association of Bay Area Government (ABAG) 2017 land use projections (Plan Bay Area 2040 land use projections) and future regional transportation infrastructure consistent with *Plan Bay Area 2040* (July 2017). In addition, the end of this memorandum includes the following list of figures showing the comparison between the MTC and VTA models.

- Figure B-1: MTC Travel Forecasting Model Transportation Analysis Zone Coverage
- Figure B-2: VTA Travel Forecasting Model Transportation Analysis Zone Coverage
- Figure B-3: MTC Travel Forecasting Model Transportation Analysis Zones and Los Gatos Jurisdictional Boundaries
- Figure B-4: VTA Travel Forecasting Model Transportation Analysis Zones and Los Gatos Jurisdictional Boundaries
- Figure B-5: MTC Travel Forecasting Model Roadway Network and Transportation Analysis Zones in Los Gatos
- Figure B-6: VTA Travel Forecasting Model Roadway Network and Transportation Analysis Zones in Los Gatos

Once a model is selected, the travel forecasting model should be checked to confirm that it is regularly calibrated and validated, that it is reasonably sensitive to future changes that can affect VMT, and whether it has any geographic limitations (such as truncating trips at a jurisdictional boundary) that would need to be compensated for when using it to produce VMT forecasts.

### Travel Analysis Zones

Land use and socioeconomic data are represented in models by Travel Analysis Zones or TAZs. A comparison of various TAZ elements between the MTC and VTA models is provided in **Table 2**. In summary, the VTA Model TAZ system has a higher resolution than the MTC Model, as well as more precise alignment with freeways, city/town, and natural boundaries. The MTC Model TAZ system is less refined within Santa Clara County and significantly less refined within the Town of Los Gatos, which could result in a higher percentage of internalized trips and a more incomplete accounting of VMT generated by Los Gatos.

**Table 2: Travel Analysis Zones (TAZ) Network Comparison**

Criteria	MTC Model	VTA Model
Model Coverage	Nine-County Bay Area.	Nine-County Bay Area, AMBAG (3 counties), and portions of Central Valley.
Santa Clara County	Coarse TAZ system, roughly matching Census Tract geography.	Smaller TAZ system than the MTC Model.
Los Gatos	9 TAZs	33 TAZs
Alignment	Boundaries are generally aligned with natural and freeway boundaries but does not match Town boundary or all major thoroughfares due to larger size of zones.	Boundaries are more precisely aligned to natural and manmade boundaries (e.g. Town boundary, freeway, main thoroughfares, etc.). Matches Town boundary better due to smaller size of zones.
Land Use Input Type	Model utilizes a separate year-specific land use input files for each scenario that include year-specific socio-economic data.	Model utilizes a separate year-specific land use input files for each scenario that include year-specific socio-economic data.
Summary	The MTC Model TAZ system is less refined within Santa Clara County and significantly less refined within the Town of Los Gatos, which could result in a higher percentage of internalized trips and a more incomplete accounting of VMT generated by Los Gatos.	The VTA Model TAZ system has a higher resolution, as well as more precise alignment with freeways, city/town and natural boundaries that may result in more complete VMT estimates.

Source: MTC and VTA models, Fehr & Peers, 2020.

## Highway Network

The highway network between the VTA and MTC models were compared, as summarized in **Table 3**. Based on our review, the VTA Model network is more detailed than the MTC network, and additional network coding could be necessary in the MTC Model in order to more fully represent the road system in Los Gatos.

**Table 3: Highway Network Comparison**

Criteria	MTC Model	VTA Model
Level of Detail	Low-Medium: Network only includes major collectors and above streets.	Medium-High: Network includes some local streets, and minor collectors and above streets.
Centroid Connectors	Collectors and residential streets are generally represented by centroid connectors.	Residential streets are generally represented by centroid connectors.

**Table 3: Highway Network Comparison**

Criteria	MTC Model	VTA Model
Attributes	<p>Link: List of attributes include distance, number of lanes, improvement years, area type, facility type, free flow speed, travel time, capacity, etc.</p> <p>Speed/Capacity: Uses speed/capacity look-up table (limited capacity to modify link speed/capacity)</p> <p>Node: Nodes do not have detailed attributes</p>	<p>Link: Similar to MTC Model.</p> <p>Speed /Capacity: Similar to MTC Model.</p> <p>Node: Similar to MTC Model</p>
Network Type	Model utilizes a separate year-specific highway network input files for each scenario.	Similar to MTC Model
Non-Auto Modes	Non-motorized skims and Transit accessibility.	Non-motorized skims and Transit accessibility.
Summary	The network has a reasonable amount of detail but not a sufficient amount to accurately measure all VMT generated by the Town without modifications.	Regional roadways and major arterial. More detailed roadway networks in both Santa Clara and San Mateo counties. The network has more detail than the MTC Model and the ability to estimate VMT to the minor arterial/collector level.

Source: MTC and VTA models, Fehr & Peers, 2020.

## Model Methods

**Table 4** provides a comparison of various model parameters, including run time, software requirement, and ease of use. In summary, the VTA Model can be run in 8-12 hours on most computers by most consultants; because it is a trip-based model it is difficult to measure VMT generated by residents and workers separately. The MTC Model takes a minimum of 24 hours and can only be run on a server-based computer by a small handful of consultants; it is an activity-based model and can measure VMT generated by residents and workers separately.

**Table 4: Model Process Comparison**

Criteria	MTC Model	VTA Model
Runtime	Base year model runtime of roughly 24 hours on a server-based computer with 32 computing cores and 128 GB of RAM.	Base year model runtime of roughly 8 to 12 hours on virtually any desktop machine.

**Table 4: Model Process Comparison**

Criteria	MTC Model	VTA Model
Type	4 step model  Activity-based model: socio-economic- based trip generation at the person-level that maintains a linkage of trips throughout the day to ensure modal consistency, making it capable of measuring VMT generated by residents and workers separately as well as a total measure of VMT generation.	4-step model  Trip-based model: socio-economic-based trip generation that gets generalized and aggregated into unlinked trips at the TAZ-level, making it difficult to measure VMT generated by residents and workers separately but fully capable of providing a total measure of VMT generation.
Model Software Platform	Citilabs – Cube/Voyager	Citilabs – Cube/Voyager
Other Required Software	Java R Python Windows Server	None
Use	Few consultants and no municipal agencies will have access to a server-based multi-core platform and the Java expertise required to run the model, limiting the pool of potential users of the model.	VTA staff has access and member agencies and use the VTA Model based on the terms of a model use agreement (no cost). Non-member agency's and developers have limited access to the travel model.
Base Year	2015	2015
Forecast Years	2020 2030 2035 2040	2025 (an intermediate scenario) 2040
Summary	The MTC Model can only be run on a server-based computer by a small handful of consultants and is capable of measuring VMT generated by residents and workers separately.	The VTA Model can be run in 8 to 12 hours on virtually any desktop machine by most agency staff or consultants; a trip-based model type makes it difficult to measure VMT generated by residents and workers separately.

## Summary of Previous Items

The *Technical Advisory* indicates that the use of tour- and trip-based approaches offers the best methods for assessing residential and office VMT but also recognizes that lead agencies have the discretion to choose their methods as outlined in the *CEQA Guidelines* Section 15064.3. The *Technical Advisory* also indicates that a tour-based assessment is ideal for residential and office VMT because it captures travel behavior more comprehensively. While this assessment aligns with the 'theory' behind these models, it does not reflect current limitations of actual models in practice today as noted above in the MTC example.

Using a travel forecasting model has some benefits over other methods such as using sketch models/spreadsheets and average trip length data because developing VMT with a travel model can account for both 'project generated VMT' and the 'project's effect on VMT' including the effect on operating speeds that will influence VMT by speed bin estimates used in a project's air quality and GHG analysis. Further, if VMT thresholds are tied to citywide/town-wide or regionwide averages, then a travel forecasting model creates a strong consistency between the threshold setting and project analysis. The use of a travel forecasting model does require special skills, maintenance time, software, and hardware resources to create a travel forecasting model which can have a moderate to high effect on staff resources depending on the travel forecasting model selected. Depending on the VMT metrics, thresholds and mitigation approach selected it is possible that the use of a travel forecasting model can be used selectively to limit the impact to staff resources and need to run the travel forecasting model too frequently. As noted earlier there is an opportunity to use a sketch model like the Santa Clara Countywide VMT Estimation Tool to assist with VMT screening of small and medium size land use projects.

When using a travel forecasting model, analysts should verify that it is accurate within the project study area and contains sufficient sensitivity to project-scale changes. Regional models off the shelf do not usually contain this level of accuracy and sensitivity for local area applications and should be calibrated and validated within the study area. This process is usually referred to as a sub-area travel model validation.

While a project may be one or several parcels, the most disaggregate level of land use in a travel model is the transportation analysis zone.<sup>2</sup> Therefore, the finest level a VMT analysis should be conducted on absent supporting substantial evidence or statistical validity is the TAZ. The TAZ size also influences the types of streets vehicle traffic is typically assigned to, for a regional forecasting model an arterial or minor arterial is the lowest street level that traffic is assigned to for a sub-regional/local travel forecasting model it is typically a collector or possibly local streets. The VTA travel forecasting model has more refined land use and transportation network than the MTC travel forecasting model. Either travel forecasting model may require an adjustment to the project generated VMT should be made to include the full length of trips that leave the travel forecasting model area to fully capture interregional travel.

---

<sup>2</sup> As defined by *NCHRP Report 716, Travel Demand Forecasting: Parameters and Techniques*, TRB, 2012, "TAZ boundaries are usually major roadways, jurisdictional borders, and geographic boundaries and are defined by homogeneous land uses to the extent possible."

# Appendix C: Frequently Asked Questions (FAQ): Evaluating Transportation Impacts in CEQA

# FAQ | Evaluating Transportation Impacts in CEQA

## Based on New Guidelines as Directed by SB 743

The Town of Los Gatos has begun the process of implementing the requirements of Senate Bill (SB) 743. SB 743 implementation will provide guidance on and set policies regarding the evaluation of transportation impacts under the California Environmental Quality Act (CEQA). SB 743 removes the use of automobile delay or traffic congestion for determining transportation impacts in environmental review. Instead, the *latest CEQA Guidelines* now specify that Vehicle Miles Traveled, or VMT<sup>1</sup>, is the appropriate metric to evaluate transportation impacts. To comply with these new rules, the Town will need to define policies and practices regarding the evaluation of transportation impacts under CEQA, including guidance on how VMT should be calculated and presented in environmental documents. In short, SB 743 changes the focus of transportation impact analysis in CEQA from measuring impacts to drivers, to measuring the impact of driving.

As stated in section 15064.7(b) of the *CEQA Guidelines*, *[e]ach public agency is encouraged to develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects*. The concept of significance (and the terms that describe it) are used in an environmental document to describe the potential environmental impact under the *CEQA Guidelines*. These FAQs use several terms to refer to this concept including significant environmental impact, significant VMT impact, significance threshold, and less-than-significant impact. Another concept used in the response to these FAQs is the term “substantial evidence” to refer to the options and information considered by the Town Council to establish its VMT threshold.

Below is a list of commonly asked questions that SB 743 brings to light. These FAQs are a good way to get oriented to the key questions that the Town of Los Gatos is considering for its implementation. A forthcoming white paper will go into greater detail about the options and evidence that the Town of Los Gatos considered when developing its VMT thresholds.

## What was the legislative intent of SB 743 (2013)?

1. Balance the needs of congestion management with the following statewide goals

---

<sup>1</sup> VMT refers to “Vehicle Miles Traveled,” a metric that accounts for the number of vehicle trips generated plus the length or distance of those trips. VMT is an accessibility performance metric that evaluates the changes in land use patterns, regional transportation systems, and other built environment characteristics, which is different from what the mobility performance metric vehicle level of service measures – vehicle mobility. The white paper will use the terms Project generated VMT and Project’s effect on VMT using boundary VMT metrics for specific geographic areas. Project generated VMT is the sum of the “VMT from” and “VMT to” and within a project site. Project’s effect on VMT uses geographic boundary VMT to evaluate the change in VMT on all roadways without and with the project within a specific geographic area.

# FAQ | Evaluating Transportation Impacts in CEQA

## Based on New Guidelines as Directed by SB 743

- a. Reduction of greenhouse gas emissions
  - b. Infill development
  - c. Public health through active transportation
2. Ensure that the environmental impacts of traffic such as noise, air pollution, and safety concerns continue to be addressed and mitigated through CEQA

## What does the new CEQA Section 15064.3 adopted by the state in December 2018 require?

1. A project's effect on automobile delay (i.e., Level of Service) shall not constitute a significant environmental impact under CEQA.
2. A lead agency may adopt these provisions immediately, but no later than July 1, 2020.
3. VMT is the "most appropriate" measure of transportation impacts.
4. Other relevant considerations may include effects on transit and non-motorized travel.
5. VMT exceeding an applicable threshold may indicate a significant impact.
6. Projects may be presumed to have a less-than-significant VMT impact if they are located in a transit priority area (TPA) or would reduce VMT.
7. A lead agency has discretion to choose the most appropriate methodology to evaluate a project's VMT.
8. A lead agency may use models to estimate a project's VMT and may revise those VMT estimates based on substantial evidence.
9. Any assumptions used to estimate VMT must be documented and explained.

## What decisions do a local agency need to make to implement these new guidelines?

1. VMT Metric?
  - a. VMT in absolute terms; or
  - b. VMT per capita, VMT per employee, or VMT per service population.
2. VMT Calculation Methods?
  - a. How to calculate VMT – Travel model, spreadsheet tool, or other methods;
  - b. Total VMT or partial VMT associated with select vehicle types, land uses, and/or trip purposes/tours; or
  - c. Project generated VMT versus project effect on VMT.
3. VMT Impact Significance Thresholds?
  - a. Threshold: Level of reduction in VMT below existing conditions;
  - b. Thresholds: (1) Project VMT and (2) Cumulative Impacts (project's effect on VMT);
  - c. Thresholds: (1) Land Use Projects, (2) Land Use Plans, (3) Transportation Projects;
  - d. Is the level of VMT reduction compared to regional VMT, townwide VMT, or other baseline; and
  - e. For towns, cities, and counties, are VMT impacts best addressed at the general plan level given that all land use decisions only influence land use supply and CEQA Section 15183

# FAQ | Evaluating Transportation Impacts in CEQA

## Based on New Guidelines as Directed by SB 743

provides streamlining for subsequent projects?

### 4. VMT Mitigation Options?

- a. VMT mitigation options for land use projects involve either changing the physical design of the project (i.e., its density, mix of use, street design, etc.) or requiring trip reduction strategies as part of a transportation demand management (TDM) program.
  - i. Are towns, cities, and counties willing to require stringent TDM programs with annual monitoring and adjustments if projects do not accomplish required VMT reductions?
  - ii. Should towns, cities, and counties instead rely on mitigation programs such as impact fee programs that are based on a VMT-reduction nexus?

## How does the OPR Technical Advisory recommend implementing CEQA Section 15064.3?

1. If the Town of Los Gatos (a lead agency in CEQA terms) uses a travel model as the basis for establishing thresholds, that same model must be used for subsequent project level VMT analyses.
2. For land use projects and plans, the *Technical Advisory* states, “OPR recommends that a per capita or per employee VMT that is fifteen percent below that of existing development may be a reasonable threshold” based on substantial evidence related to the state’s GHG reduction goals.
  - a. Residential Project Threshold: A proposed project exceeding a level of 15 percent below existing VMT per capita may indicate a significant transportation impact. Existing VMT per capita may be measured as regional VMT per capita or Town VMT per capita.
  - b. Office Project Threshold: A proposed project exceeding a level of 15 percent below existing regional VMT per employee may indicate a significant transportation impact.
  - c. Retail Project Threshold: A net increase in total VMT may indicate a significant transportation impact.
  - d. Mixed-Use Projects: Lead agencies can evaluate each component of a mixed-use project independently and apply the significance threshold for each project type included. Alternatively, a lead agency may consider only the project’s dominant use. In the analysis of each use, a project should take credit for internal capture.
3. For transportation projects, the *Technical Advisory* states:
  - a. Because a roadway expansion project can induce substantial VMT, incorporating quantitative estimates of induced VMT is critical to calculating both transportation and other impacts of the projects; and
  - b. Transit and active transportation projects generally reduce VMT and therefore are presumed to cause a less-than-significant impact on transportation.

## FAQ | Evaluating Transportation Impacts in CEQA

### Based on New Guidelines as Directed by SB 743

4. The *Technical Advisory* expands Section 15064.3 options for VMT impact screening using the presumption that certain projects will have less than significant VMT impacts based on location within a low VMT generating area or by being a locally serving retail project.
5. Impacts to Transit: *lead agencies should consider impacts to transit systems and bicycle and pedestrian networks. ...a project that blocks access to a transit stop or blocks a transit route itself may interfere with transit functions.*

### Is a lead agency required to follow recommendations in the *Technical Advisory*?

1. The *Technical Advisory* helps lead agencies think about the variety of implementation questions they face with respect to shifting to a new VMT metric.
2. The guidance is not a recipe for SB 743 implementation since lead agencies must still make their own specific decisions about methodology, thresholds, and mitigation. For towns, cities, and counties, these decisions must be consistent with their general plan, which may not be aligned with state GHG reduction goals upon which the *Technical Advisory* is based.
3. A lead agency has the discretion to choose the most appropriate methodology and thresholds to evaluate a project's VMT. A lead agency may take into account both its own policy goals and context in developing a VMT methodology and thresholds.

### What are the pros and cons of following the *Technical Advisory* guidance with respect to CEQA defensibility?

#### PROS

1. Aligns with state goals for GHG reduction, infill development, transit, active transportation, and public health.
2. Requires limited effort to implement.
3. Creates VMT impact screening opportunities for housing, employment, transit, bicycle, pedestrian, and minor roadway projects.
4. Includes specific thresholds.

#### CONS

1. Recommends only reporting partial VMT for individual land uses, trip purposes/tours, and vehicle types. For air quality, GHG, and energy impact analysis sections of an environmental document, total VMT is used.
2. Includes evidence that a 15 percent reduction from baseline may not be sufficient to achieve statewide goals for GHG reduction.
3. Does not consider local general plan role in setting threshold expectations.
4. Includes inconsistent threshold expectations based on the same land use and transportation context.

## FAQ | Evaluating Transportation Impacts in CEQA

Based on New Guidelines as Directed by SB 743

### What other challenges should a lead agency consider?

1. Direct application of the *Technical Advisory* results in significant and unavoidable VMT impacts for projects in jurisdictions with limited transit service and low land use densities even when those projects are consistent with the local general plan.
2. Lead agencies have often used transportation demand management (TDM) strategies as mitigation to reduce VMT. Most TDM strategies are project site and building tenant dependent. Since this information is typically unknown during the project entitlement and environmental review process, a lead agency must think about whether it can guarantee TDM mitigation outcomes. This implies that ongoing monitoring and adjustment of the TDM strategies may be required and that impacts are likely to remain significant even with mitigation due to the uncertainty associated with building tenant performance over time.
3. Caltrans has published [\*Local Development – Intergovernmental Review Program Interim Guidance\*](#) (September 2016) that recommends the use of VMT impact analysis now and that intergovernmental reviews include comments about VMT methodology and thresholds if not consistent with the *Technical Advisory* (Page 6).

# **Appendix D: Summary Sheet: SB 743 and the Transition from LOS to VMT**

## SB743 | Senate Bill (SB) 743 and the Transition from LOS to VMT

# Background

On September 27, 2013, Governor Jerry Brown signed SB 743 into law and started a process intended to fundamentally change transportation impact analysis as part of CEQA compliance. These changes include elimination of auto delay, level of service (LOS), and other similar measures of vehicular capacity or traffic congestion as a basis for determining significant impacts. Further, parking impacts will not be considered significant impacts on the environment for select development projects within infill areas served by frequent transit service. According to the legislative intent contained in SB 743, these changes to current practice were necessary to *"[m]ore appropriately balance the needs of congestion management with statewide goals related to infill development, promotion of public health through active transportation, and reduction of greenhouse gas emissions."*

# Implementation

To implement this intent, SB 743 required the Governor's Office of Planning and Research (OPR) to update the *CEQA Guidelines* and establish, *"... criteria for determining the significance of transportation impacts of projects within transit priority areas."* The new criteria, *"... shall promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses."* Once the Secretary of the Natural Resources Agency certified the new guidelines, then *"...automobile delay, as described solely by level of service or similar measures of vehicular capacity or traffic congestion shall not be considered a significant impact on the environment..., except in locations specifically identified in the guidelines, if any."*

OPR and the Natural Resources Agency completed their responsibilities under SB 743 as of December 2018. They recommended vehicle miles of travel (VMT) as a replacement to vehicle LOS and are applying this replacement statewide effective July 1, 2020. Lead agencies can opt-in sooner at their own discretion. The specific *CEQA Guidelines* changes can be found at <http://resources.ca.gov/ceqa/> and additional technical guidance is available from OPR at [http://opr.ca.gov/docs/20190122-743\\_Technical\\_Advisory.pdf](http://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf).

The OPR Technical Advisory includes specifications for VMT methodology and recommendations for significance thresholds and mitigation measures. As noted above, SB 743 requires impacts to transportation network performance to be viewed through a filter that promotes *the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land*

## SB743 | Senate Bill (SB) 743 and the Transition from LOS to VMT

uses. VMT can help identify how projects (land development and infrastructure) influence accessibility (i.e., access to places and people) and emissions so its selection is aligned with the objectives of SB 743. Accessibility is an important planning objective in many communities but so is travel time or delay experienced by users. SB 743 does not prevent lead agencies from continuing to analyze delay or LOS as part of other plans (i.e. the general plan), fee programs, or on-going network monitoring, but these metrics will no longer constitute the sole basis for CEQA impacts.

## Lead Agency Decisions

To implement SB 743, lead agencies will need to answer key implementation questions, including the following:

1. What form of VMT metrics could be used?
2. What methods are available to use in estimating and forecasting VMT?
3. Is the use of VMT impact screening desired?<sup>1</sup>
4. What is the VMT impact significance threshold for land use projects under baseline conditions?
5. What is the VMT impact significance threshold for land use projects under cumulative conditions?
6. What is the VMT impact significance threshold for transportation projects under baseline conditions?
7. What VMT reduction mitigation strategies are feasible?

In addition, there are three separate types of projects that are subject to CEQA review and for which VMT evaluation will be needed, so lead agencies will need to address how each of these three types will be evaluated:

- Land Use Projects: Typically development projects on a single parcel or multiple adjacent parcels;
- Land Use Plans: Such as the current General Plan update and future Specific Plans;
- Transportation Projects: Infrastructure changes such as building or removing roads, bicycle facilities, and transit facilities.

More information about SB 743 implementation can be found at <http://www.fehrandpeers.com/sb743/>.

---

<sup>1</sup> CEQA Guidelines Section 15064.3 states that projects that would reduce VMT or are located in a Transit Priority Area (TPA) should be presumed to have a less-than-significant impact on VMT. The OPR Technical Advisory contains other potential screening options.

## SB743 | Senate Bill (SB) 743 and the Transition from LOS to VMT

# Key Terms

### Vehicle Miles Traveled (VMT)

VMT refers to “Vehicle Miles Traveled,” a metric that accounts for the number of vehicle trips generated plus the length or distance of those trips. VMT is an accessibility performance metric that evaluates the changes in land use patterns, regional transportation systems, and other built environment characteristics. For transportation impact analysis, VMT is generally expressed as VMT per capita for a typical weekday. For instance, the 2012 average daily VMT per capita for the nine county Bay Area region was 15.3 miles per person per day.

For those new to VMT analysis, [this short video](#) explains VMT. We routinely analyze VMT for air quality and greenhouse gas impact analysis. SB 743 adds VMT to the transportation impact analysis of CEQA documents.

Source: <https://youtu.be/UE4TJItVdJ8>

## SB743 | Senate Bill (SB) 743 and the Transition from LOS to VMT

### Level of Service (LOS)

LOS refers to “Level of Service,” a metric that assigns a letter grade to network performance. The typical application in towns and cities is to measure the average amount of delay experienced by vehicle drivers at an intersection during the most congested time of day and assign a report card range from LOS A (fewer than 10 seconds of delay) to LOS F (more than 80 seconds of delay). Vehicle level of service is used to measure vehicle mobility.

### California Environmental Quality Act (CEQA)

CEQA refers to the “California Environmental Quality Act.” This statute requires identification of any significant environmental impacts of state or local action including approval of new development or infrastructure projects. The process of identifying these impacts is typically referred to as the environmental review process.

### Significance

As stated in section 15064.7(b) of the *CEQA Guidelines*, *[e]ach public agency is encouraged to develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects*. The concept of significance (and the terms that describe it) are used in an environmental document to describe the potential environmental impact under the *CEQA Guidelines*. Common terms used to refer to this concept of significance include significant environmental impact, significant VMT impact, significance threshold, and less-than-significant impact.

### Substantial Evidence

Another concept used in the *CEQA Guidelines* is the term “substantial evidence” to refer to the options and information considered by the Town Council to establish its VMT threshold. Specifically, section 15384 defines “substantial evidence” as:

- (a) *“Substantial evidence” as used in these guidelines means enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached. Whether a fair argument can be made that the project may have a significant effect on the environment is to be determined by examining the whole record before the lead agency. Argument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic*

## SB743 | Senate Bill (SB) 743 and the Transition from LOS to VMT

*impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence.*

- (b) *Substantial evidence shall include facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts.*

# **Appendix E: Summary of Legal Framework of SB 743 and Technical Background Information**

# Summary of Legal Framework of SB 743 and Technical Background Information

## Legal Framework of SB 743

On September 27, 2013, Governor Brown signed Senate Bill 743 (Steinberg, 2013). Among other things, SB 743 creates a process to change analysis of transportation impacts under the California Environmental Quality Act (Public Resources Code section 21000 and following).

To help aid lead agencies with SB 743 implementation, Governor's Office of Planning and Research (OPR) produced the *Technical Advisory on Evaluating Transportation Impacts in CEQA* (December 2018). The *Technical Advisory* helps lead agencies think about the variety of implementation questions they face with respect to shifting to a Vehicle Miles Traveled (VMT) metric.

The purpose of the *Technical Advisory* is to provide advice and recommendations, which agencies and other entities may use at their discretion. The guidance is not a recipe for SB 743 implementation since lead agencies must still make their own specific decisions about methodology, thresholds, and mitigation (i.e., each lead agency will bake a different looking and tasting SB 743 cake). Further, the document was intended to include guidance that would further statewide goals tied largely to greenhouse (GHG) reduction and does not attempt to balance or resolve potential conflicts between state goals with lead agency goals such as those expressed in local agency general plans.

Lead agencies will benefit from reflecting on the two legislative intent statements contained in the SB 743 statute.

1. More appropriately balance the needs of congestion management with statewide goals related to infill development, promotion of public health through active transportation, and reduction of greenhouse gas emissions.
2. Ensure that the environmental impacts of traffic, such as noise, air pollution, and safety concerns, continue to be properly addressed and mitigated through the California Environmental Quality Act.

These statements are important because they provide direction to OPR and to lead agencies. For OPR, the direction is largely about what new metrics should achieve. For lead agencies, the direction is about expected changes in transportation analysis (and related technical areas) plus what factors to consider for significance thresholds.

To implement this intent, SB 743 contains amendments to current congestion management law that allows cities and counties to effectively opt-out of the LOS standards that would otherwise apply. However, SB 743 does not prevent a city or county from continuing to analyze delay or LOS as part of other plans (i.e. the general plan), fee programs, or on-going network monitoring, but these metrics will no longer constitute the sole basis for CEQA impacts. Cities or counties can still use vehicle LOS outside of the CEQA process if they determine it is an important part of their transportation analysis process. The most common applications will likely occur for jurisdictions wanting to use vehicle LOS to size roadways in their general plan or determine nexus relationships for their impact fee programs. Jurisdictions can also continue to condition projects to build transportation improvements through the entitlement process in a variety of ways, such as using general plan consistency findings.

The *CEQA Guidelines* and the associated *Technical Advisory* are largely consistent with the legislative direction noted above such that impacts to transportation has shifted from a focus on changes to the driving experience to changes associated with driving. This new view presents an impact filter intended to promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses. VMT can help identify how projects (land development and infrastructure) influence accessibility (i.e., access to places and people) and emissions so its selection is aligned with the objectives of SB 743. Accessibility is an important planning objective in many communities but so is travel time or delay experienced by users.

## Background on the California Environmental Quality Act

The California Environmental Quality Act (CEQA) was enacted in 1970. This statute requires identification of any significant environmental impacts of state or local action including approval of new development or infrastructure projects. The process of identifying these impacts is typically referred to as the environmental review process. A fundamental component of CEQA analysis is the determination of whether a project has the potential to significantly affect the physical environment. This determination requires careful judgment on the part of the lead agency and is based on scientific and factual data to the extent possible.

## Level of Service and Vehicle Miles Traveled

**LOS** refers to “Level of Service,” a metric that assigns a letter grade to network performance. The typical application in cities is to measure the average amount of delay experienced by vehicle drivers at an intersection during the most congested time of day and assign a report card range from LOS A (fewer than 10 seconds of delay) to LOS F (more than 80 seconds of delay). The amount of delay is calculated relative to the amount of time to traverse the intersection if a vehicle is the sole vehicle on the road, and it arrives at a green light.

Traffic has long been a consideration in CEQA. In 1990, the Legislature linked implementation of congestion management plans, including LOS requirements, with CEQA. LOS has been an explicit part of CEQA analysis since at least the late 1990's, when the sample environmental checklist in the *CEQA Guidelines* asked whether a project would exceed LOS standards. (See former *CEQA Guidelines*, App. G. § XV, Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways). Because of the linkage of the CEQA environmental checklist and LOS, historically, the Town and other jurisdictions have used Level of Service (LOS) as the significant impact threshold for transportation analysis under CEQA.

**VMT** refers to "Vehicle Miles Traveled," a metric that accounts for the number of vehicle trips generated plus the length or distance of those trips. For transportation impact analysis, VMT is generally expressed as VMT per capita for a typical weekday. For instance, the 2012 average daily VMT per capita for the nine county Bay Area region was 15.3 miles per person per day.

## **Town of Los Gatos' Current Policies and Requirements for Transportation Impact Analysis**

The *Los Gatos 2020 General Plan* includes the following transportation policies:

Policy TRA-3.4 which states "New projects shall not cause the level of service for intersections to drop more than one level if it is at Level A, B, or C and not drop at all if it is at D or below."

Policy TRA-3.5 which states "If project traffic will cause any intersection to drop more than one level if the intersection is at LOS A, B, or C, or to drop at all if the intersection is at LOS D or below, the project shall mitigate the traffic so that the level of service will remain at an acceptable level."

Policy TRA-3.6 which states "Pedestrian and bicycle safety shall not be compromised to improve or maintain the level of service of an intersection."

The Town's *Traffic Impact Policy* (#1-05, March 2017) provides guidance in implementing the provisions of the Town Municipal Code, Chapter 15, Article VII, Traffic Impact Mitigation Fee. The Policy also defines the traffic impact analysis procedure, including the requirement of traffic impact analysis reports be consistent with the Transportation Impact Analysis Guidelines adopted by the Santa Clara Valley Transportation Authority.

The Town adopted a *Complete Streets Policy* in February 2019 (#3-01).

## VMT Thresholds

### Background on CEQA Thresholds

Establishing CEQA thresholds for VMT requires complying with the statutory language added by SB 743, as well as guidance contained in CEQA Guidelines Section 15064, 15064.3, and 15064.7. The excerpts below highlight the amendments to the two CEQA Guidelines Sections that were certified by the California Natural Resources Agency and the Office of Administrative Law at the end of 2018.

**§ 15064. Determining the Significance of the Environmental Effects Caused by a Project.**

(a) Determining whether a project may have a significant effect plays a critical role in the CEQA process.

(1) If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, the agency shall prepare a draft EIR.

(2) When a final EIR identifies one or more significant effects, the lead agency and each responsible agency shall make a finding under Section 15091 for each significant effect and may need to make a statement of overriding considerations under Section 15093 for the project.

(b) (1) The determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data. An ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting. For example, an activity which may not be significant in an urban area may be significant in a rural area.

(2) Thresholds of significance, as defined in Section 15064.7(a), may assist lead agencies in determining whether a project may cause a significant impact. When using a threshold, the lead agency should briefly explain how compliance with the threshold means that the project's impacts are less than significant. Compliance with the threshold does not relieve a lead agency of the obligation to consider substantial evidence indicating that the project's environmental effects may still be significant.

Source: *Final Adopted Text for the 2018 Amendments and Additions to the State CEQA Guidelines*. California Natural Resources Agency (page 8), <http://resources.ca.gov/ceqa/>

**New Section 15064.3. Determining the Significance of Transportation Impacts.**

**(a) Purpose.**

This section describes specific considerations for evaluating a project's transportation impacts. Generally, vehicle miles traveled is the most appropriate measure of transportation impacts. For the purposes of this section, "vehicle miles traveled" refers to the amount and distance of automobile travel attributable to a project. Other relevant considerations may include the effects of the project on transit and non-motorized travel. Except as provided in subdivision (b)(2) below (regarding roadway capacity), a project's effect on automobile delay shall not constitute a significant environmental impact.

**(b) Criteria for Analyzing Transportation Impacts.**

**(1) Land Use Projects.** Vehicle miles traveled exceeding an applicable threshold of significance may indicate a significant impact. Generally, projects within one-half mile of either an existing major transit stop or a stop along an existing high quality transit corridor should be presumed to cause a less than significant transportation impact. Projects that decrease vehicle miles traveled in the project area compared to existing conditions should be presumed to have a less than significant transportation impact.

**(2) Transportation Projects.** Transportation projects that reduce, or have no impact on, vehicle miles traveled should be presumed to cause a less than significant transportation impact. For roadway capacity projects, agencies have discretion to determine the appropriate measure of transportation impact consistent with CEQA and other applicable requirements. To the extent that such impacts have already been adequately addressed at a programmatic level, such as in a regional transportation plan EIR, a lead agency may tier from that analysis as provided in Section 15152.

**(3) Qualitative Analysis.** If existing models or methods are not available to estimate the vehicle miles traveled for the particular project being considered, a lead agency may analyze the project's vehicle miles traveled qualitatively. Such a qualitative analysis would evaluate factors such as the availability of transit, proximity to other destinations, etc. For many projects, a qualitative analysis of construction traffic may be appropriate.

**(4) Methodology.** A lead agency has discretion to choose the most appropriate methodology to evaluate a project's vehicle miles traveled, including whether to express the change in absolute terms, per capita, per household or in any other measure. A lead agency may use models to estimate a project's vehicle miles traveled, and may revise those estimates to reflect professional judgment based on substantial evidence. Any assumptions used to estimate vehicle miles traveled and any revisions to model outputs should be documented and explained in the environmental document prepared for the project. The standard of adequacy in Section 15151 shall apply to the analysis described in this section.

**(c) Applicability.**

The provisions of this section shall apply prospectively as described in section 15007. A lead agency may elect to be governed by the provisions of this section immediately. Beginning on July 1, 2020, the provisions of this section shall apply statewide.

**Note: Authority cited: Sections 21083 and 21099, Public Resources Code. Reference: Sections 21099 and 21100, Public Resources Code; *Cleveland National Forest Foundation v. San Diego Association of Governments* (2017) 17 Cal.App.5th 413; *Ukiah Citizens for Safety First v. City of Ukiah* (2016) 248 Cal.App.4th 256; *California Clean Energy Committee v. City of Woodland* (2014) 225 Cal. App. 4th 173.**

**§ 15064.7. Thresholds of Significance.**

(a) Each public agency is encouraged to develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects. A threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant.

(b) Each public agency is encouraged to develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects. Thresholds of significance to be adopted for general use as part of the lead agency's environmental review process must be adopted by ordinance, resolution, rule, or regulation, and developed through a public review process and be supported by substantial evidence. Lead agencies may also use thresholds on a case-by-case basis as provided in Section 15064(b)(2).

(c) When adopting or using thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.

(d) Using environmental standards as thresholds of significance promotes consistency in significance determinations and integrates environmental review with other environmental program planning and regulation. Any public agency may adopt or use an environmental standard as a threshold of significance. In adopting or using an environmental standard as a threshold of significance, a public agency shall explain how the particular requirements of that environmental standard reduce project impacts, including cumulative impacts, to a level that is less than significant, and why the environmental standard is relevant to the analysis of the project under consideration. For the purposes of this subdivision, an "environmental standard" is a rule of general application that is adopted by a public agency through a public review process and that is all of the following:

(1) a quantitative, qualitative or performance requirement found in an ordinance, resolution, rule, regulation, order, plan or other environmental requirement;

(2) adopted for the purpose of environmental protection;

(3) addresses the environmental effect caused by the project; and,

(4) applies to the project under review.

Source: *Final Adopted Text for the 2018 Amendments and Additions to the State CEQA Guidelines*. California Natural Resources Agency (pages 14-15), <http://resources.ca.gov/ceqa/>

As noted in the CEQA sections above, lead agencies have the discretion to select thresholds on a case-by-case basis or develop and publish thresholds for general use. The remainder of this memo focuses on guidance related to adopting thresholds for general use.

When developing and adopting new thresholds, the CEQA Guidelines are clear that thresholds must be supported by substantial evidence. For SB 743, the specific metric of focus is the change a project will cause in VMT, which is an indirect measure of greenhouse gas emissions and air pollution. Since VMT is already used in the analysis of air quality, energy, and GHG impacts as part of CEQA compliance, the challenge for lead agencies is to answer the question, “What type or amount of change in VMT constitutes a significant impact for transportation purposes?” CEQA Guidelines Section 15064(b)(1) allows lead agencies the discretion to select their own thresholds and allow for differences in thresholds based on context such as urban versus rural areas.

### **OPR VMT Threshold Recommendations for Land Use Projects**

SB 743 includes the following legislative intent statements, which were used to help guide OPR’s VMT threshold recommendations.

- *New methodologies under the California Environmental Quality Act are needed for evaluating transportation impacts that are better able to promote the state’s goals of reducing greenhouse gas emissions and traffic-related air pollution, promoting the development of a multimodal transportation system, and providing clean, efficient access to destinations.*
- *More appropriately balance the needs of congestion management with statewide goals related to infill development, promotion of public health through active transportation, and reduction of greenhouse gas emissions.*

To support these legislative intent statements, threshold recommendations are found in Section 15064.3 of the 2018 CEQA Guidelines amendments. and the *Technical Advisory on Evaluating Transportation Impacts in CEQA*, California Governor’s Office of Planning and Research (OPR) (December 2018). Specific excerpts and threshold highlights are provided below.

#### CEQA Guidelines Section 15064.3

##### *(b) Criteria for Analyzing Transportation Impacts.*

*(1) Land Use Projects. Vehicle miles traveled exceeding an applicable threshold of significance may indicate a significant impact. Generally, projects within one-half mile of either an existing major transit stop or a stop along an existing high quality transit corridor should be presumed to cause a less than significant transportation impact. Projects that decrease vehicle miles traveled in the project area compared to existing conditions should be presumed to have a less than significant transportation impact.*

*(2) Transportation Projects. Transportation projects that reduce, or have no impact on, vehicle miles traveled should be presumed to cause a less than significant transportation impact. For roadway capacity projects, agencies have discretion to determine the appropriate measure of transportation impact consistent with CEQA and other applicable*

*requirements. To the extent that such impacts have already been adequately addressed at a programmatic level, such as in a regional transportation plan EIR, a lead agency may tier from that analysis as provided in Section 15152.*

Technical Advisory on Evaluating Transportation Impacts in CEQA (page 10)

*Based on OPR's extensive review of the applicable research, and in light of an assessment by the California Air Resources Board quantifying the need for VMT reduction in order to meet the State's long-term climate goals, OPR recommends that a per capita or per employee VMT that is fifteen percent below that of existing development may be a reasonable threshold.*

Technical Advisory on Evaluating Transportation Impacts in CEQA – Rural Projects Outside of Metropolitan Planning Organizations (MPOs) (page 19)

*In rural areas of non-MPO counties (i.e., areas not near established or incorporated cities or towns), fewer options may be available for reducing VMT, and significance thresholds may be best determined on a case-by-case basis. Note, however, that clustered small towns and small town main streets may have substantial VMT benefits compared to isolated rural development, similar to the transit oriented development described above.*

The recognition that rural areas are different is consistent with the flexibility provided by CEQA Guidelines Section 15064(b)(1). In these areas, VMT per resident or per employee tends to be higher than in urban areas due to longer distances between origins and destinations and limited travel mode choices.

These (and the other) threshold recommendations in the *Technical Advisory* are intended to help achieve the state's GHG reduction goals and targets considered in development of OPR's *Technical Advisory* as follows;

- Assembly Bill 32 (2006) requires statewide greenhouse gas reductions to 1990 levels by 2020 and continued reductions beyond 2020.
- Senate Bill 32 (2016) requires at least a 40 percent reduction in greenhouse gas emissions by 2030.
- Pursuant to Senate Bill 375 (2008), the California Air Resources Board establishes greenhouse gas reduction targets for MPOs to achieve based on land use patterns and transportation systems specified in Regional Transportation Plans and Sustainable Community Strategies. At the time the Technical Advisory was released, target reductions by 2035 for the largest MPOs ranged from 13% to 16%. The current targets for these MPOs are 19%.
- Executive Order B-30-15 (2015) sets a GHG emissions reduction target of 40 percent below 1990 levels by 2030.

- Executive Order S-3-05 (2005) sets a GHG emissions reduction target of 80 percent below 1990 levels by 2050.
- Executive Order B-16-12 (2012) specifies a GHG emissions reduction target of 80 percent below 1990 levels by 2050 specifically for transportation.
- Senate Bill 391 requires the California Transportation Plan to support 80 percent reduction in GHGs below 1990 levels by 2050.
- The California Air Resources Board Mobile Source Strategy (2016) describes California's strategy for containing air pollutant emissions from vehicles and quantifies VMT growth compatible with achieving state targets.
- The California Air Resources Board's 2017 Climate Change Scoping Plan Update: The Strategy for Achieving California's 2030 Greenhouse Gas Target describes California's strategy for reducing greenhouse gas emissions from vehicles and quantifies VMT growth compatible with achieving state targets.
- The Caltrans Strategic Management Plan (2015) calls for a 15 percent reduction in VMT per capita compared to 2010 levels by 2020.
- Executive Order B-55-18 (2018) established an additional statewide goal of achieving carbon neutrality as soon as possible, but no later than 2045, and maintaining net negative emissions thereafter.

Lead agencies should note that the OPR-recommended VMT thresholds are focused upon GHG reduction goals. As OPR's *Technical Advisory* (p. 8) explains,

The VMT metric can support the three statutory goals: "the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses." (Pub. Resources Code, § 21099, subd. (b)(1), emphasis added.) However, in order for it to promote and support all three, lead agencies should select a significance threshold that aligns with state law on all three. State law concerning the development of multimodal transportation networks and diversity of land uses requires planning for and prioritizing increases in complete streets and infill development, but does not mandate a particular depth of implementation that could translate into a particular threshold of significance. Meanwhile, the State has clear quantitative targets for GHG emissions reduction set forth in law and based on scientific consensus, and the depth of VMT reduction needed to achieve those targets has been quantified. Tying VMT thresholds to GHG reduction also supports the two other statutory goals. Therefore, to ensure adequate analysis of transportation impacts, OPR recommends using quantitative VMT thresholds linked to GHG reduction targets when methods exist to do so.

While this is one of the SB 743 legislative intent objectives, a less clear connection is made to the other legislative intent objectives to encourage infill development and promote active transportation. SB 743 [Section 21099(b)(1)] also makes it explicit that criteria for determining the

significance of transportation impacts shall promote "...the reduction of greenhouse gas emissions, the development of multimodal networks, and a diversity of land uses." If GHG impacts are already being adequately addressed in another CEQA section, then more evidence may be desired about VMT threshold relationships to the other criteria. In particular, how should lead agencies balancing the accommodation of housing needs that contribute to land use diversity but also contribute to VMT increases? Given the status of housing supply shortages and affordability in California, this is not a small issue. The use of VMT as a new impact metric will likely trigger more significant impacts in suburban and rural areas that have the highest VMT generation rates and limited or costly mitigation options. Adding more impact mitigation costs to suburban and rural housing projects may be counter to land use diversity and adequate/affordable housing goals.

Another important distinction within the *Technical Advisory* is how projects within different land use contexts are treated. The general expectation that a 15% reduction below that of existing development may be reasonable is proposed for projects within urban areas of metropolitan planning organizations (MPOs). For rural areas outside MPOs, the *Technical Advisory* explains that VMT mitigation options are limited so thresholds may need to be set on a case-by-case basis. This rationale may not provide the best evidence for threshold setting. The intent of threshold setting is to determine what change in VMT would constitute a significant impact considering the expectations set forth in the SB 743 statute language and the associated CEQA Guidelines. While land use context is a valid consideration when setting thresholds, so are these expectations.

The *Technical Advisory* also makes specific VMT threshold recommendations for analyzing the impact of project generated VMT on baseline conditions, but also recommends that VMT analysis consider a project's long-term effects on VMT and whether the project is consistent with the Plan Bay Area [the Bay Area's Regional Transportation Plan (RTP)/Sustainable Communities Strategies (SCS)]. These recommendations raise key questions for lead agencies, as addressed in the next section.

### **Lead Agency Discretion in Setting VMT Thresholds**

Prior to SB 743 implementation, CEQA Guidelines Section 15064.7 allowed lead agencies the discretion to select their own transportation impact metrics although substantial evidence was required to support their decisions. For transportation impact metrics, SB 743 deleted vehicle delay as a metric, and CEQA Guidelines Section 15064.3 provided that, VMT is generally the most appropriate metric for land use projects. As to thresholds, additional questions have arisen as listed below.

- Question 1: Do lead agencies have discretion to set a different VMT threshold than recommended by OPR?
- Question 2: Do lead agencies need to establish VMT thresholds for cumulative impacts?
- Question 3: Do lead agencies need to use the same VMT methodology for setting thresholds and for conducting project VMT forecasts?

The answers to the first two questions require a legal perspective and were informed by a memorandum prepared by Remy Moose Manley (RMM) as part of the WRCOG SB 743 Implementation Pathway project, whose opinion is summarized below. Their full opinion is available as part of the WRCOG documentation at <http://www.fehrandpeers.com/wrcog-sb743/> while a summary of their selected findings is presented below.

*Question 1: Do lead agencies have discretion to set a different VMT threshold than recommended by OPR?*

Setting a threshold lower than the 15-percent reduction recommended by OPR in their *Technical Advisory* is likely legally defensible, so long as the threshold is supported by substantial evidence. The substantial evidence is critical in the threshold setting process and should explain why the OPR-recommended threshold is not appropriate for the lead agency or project, and why another threshold was selected. This evidence will be the basis for supporting the recommended threshold and should carefully consider the definition of substantial evidence contained Section 15384 of the CEQA Guidelines. This answer considers the fact that the 15-percent reduction is not included in the statute or the updated CEQA Guidelines; rather it is only included in OPR's *Technical Advisory*. However, it is unknown how much weight future courts may give OPR's *Technical Advisory* since this is where OPR complies with Section 21099(b)(1) to develop recommendations for significance criteria.

The revisions to the CEQA Guidelines only include statements about what land use project types and locations may be presumed to have a less than significant VMT impact. Additional evidence allowing for a lower threshold (i.e., less than 15 percent) is also found in the discussion above about the recognition of land use context influencing VMT performance.

*Question 2: Do lead agencies need to establish VMT thresholds for cumulative impacts?*

In addition to direct impact analysis, lead agencies should address VMT impacts in the cumulative context. The CEQA Guidelines (and the case law) are clear that consideration of cumulative impacts is important to CEQA compliance. That said, a separate quantitative threshold may not be required if the threshold applied for project-specific impacts is cumulative in nature. VMT thresholds based on an efficiency form of the metric such as VMT per capita, can address both project and cumulative impacts in a similar manner that some air districts do for criteria pollutants and GHGs.

As explained in OPR's *Technical Advisory*, when using an absolute VMT metric, i.e., total VMT (as recommended below for retail and transportation projects), analyzing the combined impacts for a cumulative impacts analysis may be appropriate. A project that falls below an efficiency-based threshold that is aligned with long-term environmental goals and relevant plans would have no cumulative impact distinct from the project impact. Accordingly, a finding of a less-than-

significant project impact would imply a less than significant cumulative impact, and vice versa. (OPR *Technical Advisory*, p. 6.)

A key consideration for cumulative scenarios is whether the rate of VMT generation gets better or worse in the long-term. If the rate is trending down over time, then the project level analysis may suffice. However, the trend direction must be supported with substantial evidence. This creates a potential issue for VMT because per capita VMT rates in California have been increasing, a trend inconsistent with RTP/SCS projections showing declines. The chart below from the 2018 Progress Report California's Sustainable Communities and Climate Protection Act, California Air Resources Board, November 2018 charts recent VMT per capita trends. This evidence could be used to justify the need for separate cumulative analysis to verify a project's long-term cumulative effects.

**Figure 1: California VMT Trends**

Source: 2018 Progress Report California's Sustainable Communities and Climate Protection Act, California Air Resources Board, 2018

For some projects, measuring project-generated VMT will only tell part of the impact story especially if they exceed a project threshold based on VMT per capita or similar efficiency metric. Measuring the “project’s effect on VMT” may be necessary to fully explain the project’s impact especially under cumulative conditions. This occurs because of the nature of discretionary land use decisions. Cities and counties influence land supply through changes to general plan land use designations and zoning for parcels. These changes rarely, if ever, influence the long-term amounts of regional population and employment growth. Viewed through this lens, a full disclosure of VMT effects requires capturing how a project may influence the VMT generated by the project and nearby land uses. Also, some mitigation strategies that improve walking, bicycling, or transit to/from the project site can also reduce VMT from neighboring land uses (for example, installing a bike share station on the project site would influence the riding behavior of project residents and those living and working nearby).

*Question 3: Do lead agencies need to use the same VMT methodology for setting thresholds and for conducting project VMT forecasts?*

Lead agencies need to use consistent methods when forecasting VMT for threshold setting and project analysis to ensure an apples-to-apples comparison for identifying potential impacts. The failure to comply with this approach, as recommended by the *Technical Advisory*, can lead to erroneous impact conclusions. This is important since the *Technical Advisory* also accepts that VMT analysis can be performed using sketch planning tools. Off-the-shelf sketch planning tools for VMT analysis do not contain trip generation rates or trip lengths consistent with local and regional travel forecasting models. These models are the most likely source for townwide/citywide and regionwide VMT estimates used in setting thresholds because sketch planning tools cannot produce these aggregate-level VMT metrics. The *Technical Advisory* partially recognizes this issue by recommending that sketch planning tools use consistent trip lengths as the models used to produce thresholds, but it does not include a similar recommendation for trip generation rates. Both input variables, trip lengths and trip generation rates, need to be consistent with the travel forecasting model to produce accurate project impact analysis results.

## Options for the Town of Los Gatos

So how should lead agencies approach VMT threshold setting given their discretion? Since an impact under CEQA begins with a change to the existing environment, a starting level for potential thresholds would be the baseline (i.e., existing condition) VMT, VMT per capita, VMT per employee, or VMT per service population. Since VMT would normally be expected to increase or fluctuate with population and employment growth, changes in economic activity, and expansion of new vehicle travel choices (i.e., Uber, Lyft, autonomous vehicles, etc.), expressing VMT measurement in an efficiency metric form allows for more direct comparisons to baseline conditions for land use projects, land use plans, and transportation projects. Establishing a

threshold such as baseline VMT per service population would be essentially setting an expectation that future land uses will perform like existing land uses.

If VMT performance expectations start with baseline conditions, lead agencies can establish reductions from baseline levels, thereby lowering future VMT generation. How much of a reduction may depend on the values placed on vehicle use and its associated effects on mobility, economic activity, and environmental consequences. Working toward higher reductions in VMT becomes possible as the land use context changes to urban areas with higher densities and high-quality transit systems.

While OPR has developed specific VMT impact threshold recommendations for project-related impacts, current practice has not sufficiently evolved where a clear line can be drawn between “acceptable” and “unacceptable” levels of VMT change for the sole purpose of determining a significant transportation impact. Until SB 743, VMT changes were viewed through an environmental lens that focused on the relationship of VMT to fuel consumption and emissions. For transportation purposes, VMT has traditionally been used to evaluate whether land use or transportation decisions resulted in greater dependency on vehicle travel. Determining whether a portion of someone’s daily vehicle travel is unacceptable or would constitute a significant transportation impact is generally not clear to lead agencies.

Another consideration in threshold setting is how to address cumulative VMT impacts and whether addressing them in the General Plan EIR is advantageous for streamlining the review of subsequent land use and transportation projects, given CEQA relief available through SB 375 or CEQA Guidelines Section 15183. This section of the Guidelines relieves a project of additional environmental review if the environmental impact was adequately addressed in the General Plan EIR and the project is consistent with the General Plan (see below).

#### **15183. PROJECTS CONSISTENT WITH A COMMUNITY PLAN OR ZONING**

(a) CEQA mandates that projects which are consistent with the development density established by existing zoning, community plan, or general plan policies for which an EIR was certified shall not require additional environmental review, except as might be necessary to examine whether there are project-specific significant effects which are peculiar to the project or its site. This streamlines the review of such projects and reduces the need to prepare repetitive environmental studies.

The use of Section 15183 also addresses cumulative impacts as acknowledged in Section 15130(e).

#### **15130. DISCUSSION OF CUMULATIVE IMPACTS**

(e) If a cumulative impact was adequately addressed in a prior EIR for a community plan, zoning action, or general plan, and the project is consistent with that plan or action, then

an EIR for such a project should not further analyze that cumulative impact, as provided in Section 15183(j).

For the Town of Los Gatos, addressing transportation VMT impacts in the Town General Plan EIR could be useful in understanding how VMT reduction should be balanced against other community values when it comes to setting new VMT impact thresholds for SB 743.

Given this information, the Town of Los Gatos has at least four options for setting VMT thresholds.

- Option 1: Rely on the OPR *Technical Advisory* suggestion to set thresholds consistent with State of California goals for air quality, greenhouse gas, and energy conservation.
- Option 2: Use a threshold adopted or recommended by another public agency consistent with lead agency air quality, GHG reduction, and energy conservation goals
- Option 3: Set jurisdiction-specific VMT thresholds based on substantial evidence
- Option 4: Set thresholds based on baseline VMT performance

Each of these options is discussed below.

*Option 1: Rely on the OPR Technical Advisory suggestion to set thresholds consistent with State of California goals for air quality, greenhouse gas, and energy conservation.*

The first option is to simply rely on the threshold recommendations contained in the OPR *Technical Advisory*. As noted above, the general expectation is that land use projects should be measured against VMT per capita or VMT per worker threshold of 15% below that of baseline conditions (i.e., existing development). Specific VMT thresholds for residential, office (work-related), and retail land uses are summarized below.

- Residential projects – A proposed project exceeding a level of 15% below existing (baseline) VMT per capita may indicate a significant transportation impact. Existing VMT per capita may be measured as regional VMT per capita, a citywide VMT per capita, or as geographic sub-area VMT per capita.
- Office projects – A proposed project exceeding a level of 15% below existing (baseline) regional VMT per employee may indicate a significant transportation impact.
- Retail projects – A net increase in total (boundary) VMT may indicate a significant transportation impact.
- Mixed-use projects – Lead agencies can evaluate each component of a mixed-use project independently and apply the significance threshold for each project type included (e.g., residential and retail). Alternatively, a lead agency may consider only the project's dominant use. In the analysis of each use, a project should take credit for internal capture.

- Other non-residential project types – OPR recommends using the quantified thresholds above, thus a proposed project exceeding a level of 15 percent below existing regional VMT per employee for the proposed non-residential project type or resulting in a net increase in total (boundary) VMT may be considered significant. Lead agencies, using more location-specific information, may develop their own more specific thresholds, which may include other land use types.
- Redevelopment projects – Where a project replaces existing VMT-generating land uses, if the replacement leads to a net overall decrease in VMT, the project would lead to a less-than-significant transportation impact. If the project leads to a net overall increase in VMT, then the thresholds described above should apply.

For land use plans (i.e., a general plan, policy area plan, or specific area plan), a significant impact would occur if the respective thresholds above were exceeded in aggregate. This means that new population and employment growth combined with the planned transportation network would need to generate future VMT per capita or VMT per worker that is less than 85% of the baseline value to be considered less than significant. Land use project and land use plans would also need to be consistent with the jurisdiction General Plan.

A potential limitation of the OPR recommendations is that the substantial evidence used to justify the thresholds is largely based on the State of California air quality and GHG goals. Three issues arise from this reliance:

1. The OPR-recommended threshold does not establish a level of VMT reduction that would result in California meeting its air quality and GHG goals according to the *California Air Resources Board 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals* (2019). This may create confusion with air quality and GHG impact analysis in environmental documents, which should already address the influence of VMT.
2. The OPR-recommended thresholds do not directly reflect expectations related to the other SB 743 objectives related to statewide goals to promote public health through active transportation, infill development, multimodal networks, and a diversity of land uses. Recommending a reduction below baseline levels is consistent with these objectives, but the numerical value has not been tied to specific statewide values for each objective or goal.
3. State of California expectations for air quality and GHG may not align with local/lead agency expectations. Using State expectations for a local lead agency threshold may create inconsistencies with local city or county general plans.

*Option 2: Use a threshold adopted or recommended by another public agency consistent with lead agency air quality, GHG reduction, and energy conservation goals*

This option sets a threshold consistent with local air quality, GHG reduction, and energy conservation goals. This approach requires that local air quality and GHG reduction goals in general plans, climate action plans, or GHG reduction plans comply with the legislation and associated plans described earlier.

- 2000 levels by 2010
- 1990 levels by 2020
- 80% below 1990 levels by 2050

SB 32 expanded on these goals and added the expectation that the state should reach 40% below 1990 levels by 2030, followed by SB 391 requirements for the California Transportation Plan to support 80% reduction in GHGs below 1990 levels by 2050. With respect to the land use and transportation sectors, SB 375 tasked CARB with setting specific GHG reduction goals through the RTP/SCSs prepared by MPOs.

The CARB *Scoping Plan* and *Mobile Source Strategy* provide analysis related to how the state can achieve the legislative and executive goals, while the Caltrans *Strategic Management Plan* and *Smart Mobility Framework* provide supportive guidance and metrics. An important recognition of the CARB *Scoping Plan* and *Mobile Source Strategy* is that the initial SB 375 targets were not aggressive enough. The CARB *2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals* document provides updated information on VMT reductions needed to meet the State's GHG emission reduction targets by 2050. This document identifies two specific thresholds to meet these targets, a 14.3% reduction in total project generated VMT per capita, and a 16.8% reduction in light-duty vehicle project generated VMT per capita. While this evidence is tied largely to the State of California's emission reduction goals, the proposed project generated VMT reductions associated with this approach to thresholds would be supportive of multimodal networks, infill development, and greater land use diversity.

[https://ww2.arb.ca.gov/sites/default/files/2019-01/2017\\_sp\\_vmt\\_reductions\\_jan19.pdf](https://ww2.arb.ca.gov/sites/default/files/2019-01/2017_sp_vmt_reductions_jan19.pdf)

**Figure 3: Statewide Light-Duty VMT/Capita**

Source: 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals, CARB (p. 11)

[https://ww2.arb.ca.gov/sites/default/files/2019-01/2017\\_sp\\_vmt\\_reductions\\_jan19.pdf](https://ww2.arb.ca.gov/sites/default/files/2019-01/2017_sp_vmt_reductions_jan19.pdf)

One benefit of relying on CARB or other state agencies for a threshold recommendation is the CEQA Guidelines provision in Section 15064.7(c) highlighted below.

**§ 15064.7. Thresholds of Significance.**

(a) ~~Each public agency is encouraged to develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects.~~ A threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant.

(b) ~~Each public agency is encouraged to develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects.~~ Thresholds of significance to be adopted for general use as part of the lead agency's environmental review process must be adopted by ordinance, resolution, rule, or regulation, and developed through a public review process and be supported by substantial evidence. Lead agencies may also use thresholds on a case-by-case basis as provided in Section 15064(b)(2).

(c) When adopting or using thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.

Source: Final Adopted Text for the 2018 Amendments and Additions to the State CEQA Guidelines. California Natural Resources Agency (p. 14) <http://resources.ca.gov/ceqa/>

CARB meets the criteria of being a public agency and having noted expertise in the areas of VMT and emissions analysis. Further, the recommended threshold values above were developed in specific consideration of SB 743 requirements.

One other agency threshold to consider is Caltrans. The Local Development-Intergovernmental Review (LD-IGR) Branch at Caltrans (<https://dot.ca.gov/programs/transportation-planning/office-of-smart-mobility-climate-change/local-development-intergovernmental-review>) has a responsibility to reduce potential adverse impacts of local development on the state transportation system. As part of its responsibilities, each district branch performs reviews of CEQA environmental documents for local land use projects. These reviews include providing expectations for transportation impact analysis, such as metrics and thresholds.

When Caltrans reviews CEQA documents, they may function as a reviewing agency or a responsible agency. In a responsible agency role, Caltrans has approval authority over some component of the project, such as an encroachment permit for access to the state highway system. Comments from Caltrans should be adequately addressed, and special attention should

be paid to those comments when Caltrans serves as a responsible agency because an adequate response may be required to obtain its required approval.

Caltrans recently released a draft update to its Transportation Impact Study Guide (<https://dot.ca.gov/-/media/dot-media/programs/transportation-planning/documents/sb-743/2020-02-26-transmittal-and-draft-vmt-focused-tisg.pdf>). Key points from this draft include the following:

- Caltrans recommends use of OPR's recommended thresholds for land use projects.
- Caltrans supports CEQA streamlining for land use projects in transit priority areas and areas with existing low VMT, as described in OPR's *Technical Advisory*.
- Caltrans recommends following the guidance on methods of VMT assessment found in OPR's *Technical Advisory*.
- Caltrans comments on a CEQA document may note methodological deviations from those methods and may recommend that significance determinations and mitigation be aligned with State of California GHG reduction goals as articulated in that guidance, ARB's *Scoping Plan*, and related documentation.
- In rural areas, Caltrans may comment requesting VMT-reducing strategies for the rural area be included programmatically, including at the General Plan level, for example. Caltrans will also recommend establishment of programs or methods to reduce VMT and support appropriate bicycle, pedestrian, and transit infrastructure, services, or incentives.

With Caltrans endorsement of the recommended OPR thresholds, a state VMT threshold has been established for impacts to the state highway system. If a lead agency chooses a different threshold, they may have to complete more than one impact analysis.

### *Option 3: Set jurisdiction-specific VMT threshold based on substantial evidence*

VMT is a composite metric that is created as an output of combining a community's long-term population and growth projections with its long-term transportation network (i.e., the General Plan). Other variables are also in play related to travel behavior, but land use changes and transportation network modifications are the items largely influenced or controlled by cities and counties. As such, each jurisdiction already has a VMT growth budget. This is the amount of VMT that is forecast to be generated from the jurisdiction's General Plan and the jurisdiction's buildout scenario assumptions combined with other travel behavior inputs for the region as captured in the travel forecasting model. This VMT growth has already been planned for and determined to be "acceptable" by the jurisdiction. Regional and state agencies also use the General Plan growth as part of their plans and environmental impact analysis. This level of VMT could serve as the basis of a VMT threshold expressed as a VMT growth budget or as a VMT efficiency metric based on the future year VMT per capita, VMT per employee, or VMT per service population. The measurement of VMT could occur at the geographic subarea level.

Potential limitations of this approach relate to the lack of a “baseline plus project” analysis and travel forecasting model sensitivity. If a General Plan includes policies or implementation programs designed to reduce VMT through transportation demand management (TDM) strategies, the current local and regional models did not include these effects. Further, current local and regional models do not capture major disruptive trend effects such as TNCs, AVs, and internet shopping. Including baseline and baseline plus project analysis could help capture some of these effects to the extent they are already influencing travel behavior.

*Option 4: Set thresholds based on baseline VMT performance*

As noted above, an impact under CEQA begins with a change to the existing or baseline environment. There are a range of approaches to using this starting point for VMT impact analysis. At one end of the spectrum is “total daily VMT” generated under baseline conditions. Setting this value as the threshold for a jurisdiction basically creates a budget where any increase would be a significant impact. Alternatively, the baseline VMT per capita, VMT per employee, or VMT per service population could be used to establish an efficiency metric basis for impact evaluation. Using this form of VMT would mean that future land use projects would be expected to perform no worse than existing land use projects, and only projects that cause an increase in the rate of VMT generation would cause significant impacts. Since VMT will increase or fluctuate with population and employment growth, changes in economic activity, and expansion of new vehicle travel choices (i.e., Uber, Lyft, autonomous vehicles, etc.), expressing VMT measurement in an efficiency metric form allows for more direct comparisons to baseline conditions for land use projects, land use plans, and transportation projects.

Under this option, a separate quantitative VMT threshold may not be set for cumulative conditions unless VMT trends are increasing over time. At a minimum, a qualitative assessment of RTP and General Plan consistency may still be included, depending on whether that analysis is already being conducted for the purposes of GHG impact analysis. In general, projects should avoid jeopardizing the air quality conformity and GHG reduction performance of other relevant plans.

# Appendix G: List of Transportation Projects Exempt from Environmental Analysis (CEQA)

## List of Transportation Projects Exempt from Environmental Analysis (CEQA)

The following complete list is provided in the OPR Technical Advisory (December 2018, Pages 20-21) for transportation projects that “would **not** likely lead to a substantial or measurable increase in vehicle travel, and therefore generally should not require an induced travel analysis:”

- Rehabilitation, maintenance, replacement, safety, and repair projects designed to improve the condition of existing transportation assets (e.g., highways; roadways; bridges; culverts; Transportation Management System field elements such as cameras, message signs, detection, or signals; tunnels; transit systems; and assets that serve bicycle and pedestrian facilities) and that do not add additional motor vehicle capacity
- Roadside safety devices or hardware installation such as median barriers and guardrails
- Roadway shoulder enhancements to provide “breakdown space,” dedicated space for use only by transit vehicles, to provide bicycle access, or to otherwise improve safety, but which will not be used as automobile vehicle travel lanes
- Addition of an auxiliary lane of less than one mile in length designed to improve roadway safety
- Installation, removal, or reconfiguration of traffic lanes that are not for through traffic, such as left, right, and U-turn pockets, two-way left turn lanes, or emergency breakdown lanes that are not utilized as through lanes
- Addition of roadway capacity on local or collector streets provided the project also substantially improves conditions for pedestrians, cyclists, and, if applicable, transit
- Conversion of existing general purpose lanes (including ramps) to managed lanes or transit lanes, or changing lane management in a manner that would not substantially increase vehicle travel
- Addition of a new lane that is permanently restricted to use only by transit vehicles
- Reduction in number of through lanes
- Grade separation to separate vehicles from rail, transit, pedestrians or bicycles, or to replace a lane in order to separate preferential vehicles (e.g., HOV, HOT, or trucks) from general vehicles
- Installation, removal, or reconfiguration of traffic control devices, including Transit Signal Priority (TSP) features
- Installation of traffic metering systems, detection systems, cameras, changeable message signs and other electronics designed to optimize vehicle, bicycle, or pedestrian flow
- Timing of signals to optimize vehicle, bicycle, or pedestrian flow
- Installation of roundabouts or traffic circles
- Installation or reconfiguration of traffic calming devices
- Adoption of or increase in tolls
- Addition of tolled lanes, where tolls are sufficient to mitigate VMT increase

## List of Transportation Projects Exempt from Environmental Analysis (CEQA)

- Initiation of new transit service
- Conversion of streets from one-way to two-way operation with no net increase in number of traffic lanes
- Removal or relocation of off-street or on-street parking spaces
- Adoption or modification of on-street parking or loading restrictions (including meters, time limits, accessible spaces, and preferential/reserved parking permit programs)
- Addition of traffic wayfinding signage
- Rehabilitation and maintenance projects that do not add motor vehicle capacity
- Addition of new or enhanced bike or pedestrian facilities on existing streets/highways or within existing public rights-of-way
- Addition of Class I bike paths, trails, multi-use paths, or other off-road facilities that serve non-motorized travel
- Installation of publicly available alternative fuel/charging infrastructure
- Addition of passing lanes, truck climbing lanes, or truck brake-check lanes in rural areas that do not increase overall vehicle capacity along the corridor

# Appendix H: Small Project Screening for SB 743

## SMALL PROJECT SCREENING FOR SB743

The following document provides substantial evidence to support the screening on 'small' projects for SB 743 purposes. The OPR Technical Advisory relies on a trip trigger based on CEQA exemptions.

### *Screening Threshold for Small Projects*

Many local agencies have developed screening thresholds to indicate when detailed analysis is needed. Absent substantial evidence indicating that a project would generate a potentially significant level of VMT, or inconsistency with a Sustainable Communities Strategy (SCS) or general plan, projects that generate or attract fewer than 110 trips per day<sup>19</sup> generally may be assumed to cause a less-than-significant transportation impact.

### *Map-Based Screening for Residential and Office Projects*

Residential and office projects that locate in areas with low VMT, and that incorporate similar features (i.e., density, mix of uses, transit accessibility), will tend to exhibit similarly low VMT. Maps created with VMT data, for example from a travel survey or a travel demand model, can illustrate areas that are

---

<sup>19</sup> CEQA provides a categorical exemption for existing facilities, including additions to existing structures of up to 10,000 square feet, so long as the project is in an area where public infrastructure is available to allow for maximum planned development and the project is not in an environmentally sensitive area. (CEQA Guidelines, § 15301, subd. (e)(2).) Typical project types for which trip generation increases relatively linearly with building footprint (i.e., general office building, single tenant office building, office park, and business park) generate or attract an additional 110-124 trips per 10,000 square feet. Therefore, absent substantial evidence otherwise, it is reasonable to conclude that the addition of 110 or fewer trips could be considered not to lead to a significant impact.

Two potential limitations of this trigger have been identified. First, the trigger is not tied to a VMT estimate. Second, the trigger does not consider residential land uses. To strengthen the evidence, we used specific CEQA exemptions related to residential projects and 2012 California Household Travel Survey (CHTS) household VMT estimates to develop the following modification to the OPR approach. The CEQA exemption sections are provided below.

### **15303. NEW CONSTRUCTION OR CONVERSION OF SMALL STRUCTURES**

Class 3 consists of construction and location of limited numbers of new, small facilities or structures; installation of small new equipment and facilities in small structures; and the conversion of existing small structures from one use to another where only minor modifications are made in the exterior of the structure. The numbers of structures described in this section are the maximum allowable on any legal parcel. Examples of this exemption include, but are not limited to:

(a) One single-family residence, or a second dwelling unit in a residential zone. In urbanized areas, up to three single-family residences may be constructed or converted under this exemption.

(b) A duplex or similar multi-family residential structure, totaling no more than four dwelling units. In urbanized areas, this exemption applies to apartments, duplexes and similar structures designed for not more than six dwelling units.

(c) A store, motel, office, restaurant or similar structure not involving the use of significant amounts of hazardous substances, and not exceeding 2500 square feet in floor area. In urbanized areas, the exemption also applies to up to four such commercial buildings not exceeding 10,000 square feet in floor area on sites zoned for such use if not involving the use of significant amounts of hazardous substances where all necessary public services and facilities are available and the surrounding area is not environmentally sensitive.

**Note:** Authority cited: Section 21083, Public Resources Code; Reference: Sections 21084, Public Resources Code.

### 15315. MINOR LAND DIVISIONS

Class 15 consists of the division of property in urbanized areas zoned for residential, commercial, or industrial use into four or fewer parcels when the division is in conformance with the General Plan and zoning, no variances or exceptions are required, all services and access to the proposed parcels to local standards are available, the parcel was not involved in a division of a larger parcel within the previous 2 years, and the parcel does not have an average slope greater than 20 percent.

**Note:** Authority cited: Sections Section 21083, Public Resources Code; Reference: Section 21084, Public Resources Code.

Based on the 2012 CHTS, here are a range of VMT estimates for 2, 4, and 6 units based on the CA and SACOG average VMT generation per household.

CA Average – 41.6 VMT per household

- 2 units = 83.2 VMT per day
- 4 units = 166.4 VMT per day
- 6 units = 249.6 VMT per day (urban areas only)

SACOG Average – 42.9 VMT per household

- 2 units = 85.8 VMT per day
- 4 units = 171.6 VMT per day
- 6 units = 257.4 VMT per day (urban areas only)

Another option is to rely on the maximum level of development allowed by CEQA exemptions and convert that value to a 'dwelling unit equivalent' measure similar to impact fee programs. OPR estimated that non-residential uses could generate 110-124 daily trips based on a maximum project exemption size of 10,000 square feet (KSF). Using the lower end of the range and CHTS trip lengths produces a VMT equivalent for 10 KSF for CA and SACOG of 836 and 869, respectively. This equates to about 20 residential households.

# Appendix I: VMT Characteristics of the Town of Los Gatos

## New VMT Rates Calculated Based on Recalibrated Model

JURISDICTION	HVMT	EVMT	POPULATION	JOB	HVMT_PER_CAPITA	EVMT_PER_EMP

# VMT Mitigation Through Banks and Exchanges

UNDERSTANDING NEW MITIGATION APPROACHES

A WHITE PAPER PREPARED BY

FEHR & PEERS

# VMT MITIGATION THROUGH BANKS AND EXCHANGES

## Understanding New Mitigation Approaches

---

### **BACKGROUND**

On September 27, 2013, Governor Jerry Brown signed SB 743 into law and started a process intended to fundamentally change transportation impact analysis as part of CEQA compliance. These changes include elimination of *auto delay*, *level of service (LOS)*, and *other similar measures of vehicular capacity or traffic congestion* as a basis for determining significant impacts. Instead, transportation impacts will be determined based on changes to vehicle miles of travel (VMT). This change essentially shifts the focus of analysis from impacts to drivers through higher delays to the impact of driving itself.

Lead agencies making the transition to VMT are realizing the challenges of using the new metric especially when it comes to mitigating significant VMT impacts. Reducing VMT from land use projects and land use plans has traditionally been accomplished through transportation demand management (TDM) strategies. These strategies include modifying a project's land use characteristics (i.e., density) and incorporating vehicle trip reduction programs at the project site to change travel behavior of tenants and visitors. TDM is most effective in urban areas where a project site is accessible through multiple travel modes (i.e., walking, bicycling, transit, and vehicle) offering similar travel times and convenience. Conversely, TDM strategies are less effective in lower density suburban and rural areas where modes are generally limited to personal vehicles. In these types of areas, a program-based approach to mitigation may be more effective than project-site only strategies. Under a program-based approach, development mitigation contributions can be pooled to pay for VMT reduction strategies that would not be feasible for individual projects to implement.

### **PROGRAM CONCEPTS**

The concept of a 'program' approach to impact mitigation is not new and has been used for a variety of technical subjects including transportation, air quality, greenhouse gases, and habitat. Transportation impact fee programs have been used to help mitigate cumulative level of service (LOS) impacts. What is new are how to use impact fee programs for VMT impacts and alternative programs called Mitigation Exchanges and Banks. Absent new program-level mitigation options, suburban and rural lead agencies will have limited feasible mitigation options for project sites.

**For CEQA purposes, feasible means  
"capable of being accomplished in a  
successful manner within a reasonable  
period of time, taking into account  
economic, environmental, legal, social,  
and technological factors."**

**- CEQA Guidelines Section 15364**

Without feasible mitigation, significant VMT impacts would be significant and unavoidable (SAU). Under these circumstances a project must prepare an environmental impact report (EIR) adding extra time and cost to environmental review compared to a negative declaration (ND). Program-based approaches may be able to overcome the limitation of project-site only mitigation. Three specific concepts as described below have been identified for the purposes of this white paper.

- **VMT-based Transportation Impact Fee program (VMT-TIF)** – The first program concept is a traditional impact fee program in compliance with the mitigation fee act. The nexus for the fee program would be a VMT reduction goal consistent with the CEQA threshold established by a lead agency for SB 743 purposes. The City of LA is the first in California to complete a nexus study for this type of program. The main difference from a fee program based on a metric such as vehicle level of service (LOS) is that the VMT reduction nexus results in a capital improvement program (CIP) consisting largely of transit, bicycle, and pedestrian projects. These types of fee programs are time consuming to develop, monitor, and maintain but are recognized as an acceptable form of CEQA mitigation if they can demonstrate that the CIP projects will be fully funded and implemented.
- **VMT Mitigation Exchange** – In simple terms, the Exchange concept relies on a developer agreeing to implement a predetermined VMT reducing project or proposing a new one. The project may be located in the vicinity of the project or elsewhere in the community, and possibly outside the community. The Exchange needs to have a facilitating entity that can match the VMT generator (the development project) with a VMT reducing project or action. The facilitating entity could be the lead agency or another entity that has the ability to provide the match and to ensure through substantial evidence that the VMT reduction is valid. A key unknown with this approach is the time period for VMT reduction. For example, how many years of VMT reduction are required to declare a VMT impact less than significant?
- **VMT Mitigation Bank** – A Mitigation Bank attempts to create a monetary value for VMT reduction such that a developer could purchase VMT reduction credits. The money exchanged for credits could be applied to local, regional, or state level VMT reduction projects or actions. Like all VMT mitigation, substantial evidence would be necessary that the projects covered by the Bank would achieve expected VMT reductions and some form of monitoring may be required. This is more complicated than a simple exchange and would require more time and effort to set up and implement. The verification of how much VMT reduction is associated with each dollar or credit would be one of the more difficult parts of the program.

With both Exchanges and Banks, another important test is that the VMT reduction would not have occurred otherwise such that mitigation program creates 'additionality'. This means that additional VMT reduction will occur above and beyond what would have occurred without the program. For any program to qualify as a CEQA mitigation program, the discretionary action to adopt the program may require CEQA review. This conclusion is based on the *California Native Plant Society v. County of El Dorado* where the court found that payment of fee does not presumptively establish full mitigation of a discretionary project. A separate CEQA review of the program is necessary to satisfy the duty to mitigate imposed by CEQA. Decision makers should also realize that absent a VMT reduction program, developers would likely be limited to only project site mitigation. While this may be less effective, it may also limit their mitigation costs because the available and feasible mitigation would be more limited.

More details about Exchanges and Banks are explained in the framework document shown at right and available at the cited web link. This white paper expands on the framework to accomplish two objectives. The first objective is to compare the pros and cons of exchanges and banks to a traditional impact fee program. Since impact fee programs have already been established as feasible CEQA mitigation, they serve as a benchmark against which to compare other program concepts. The second objective is to outline the implementation steps associated with creating an exchange or bank to help identify key implementation questions or issues that could affect their feasibility.

## **PROGRAM ASSESSMENT (Pros/Cons)**

Table 1 below outlines the pros and cons of approach VMT mitigation through an impact fee program, exchange, or bank. This assessment is intended to highlight some of the key differences between each program concept.

<https://www.law.berkeley.edu/research/clee/research/climate/transportation/vehicle-miles-traveled/>

**Table 1 – VMT Mitigation Program Type Comparison**

Program Type	Pros	Cons
Impact Fee Program	<ul style="list-style-type: none"> <li>• Common and accepted practice</li> <li>• Accepted for CEQA mitigation</li> <li>• Adds certainty to development costs</li> <li>• Allows for regional scale mitigation projects</li> <li>• Increases potential VMT reduction compared to project site mitigation only</li> </ul>	<ul style="list-style-type: none"> <li>• Time consuming and expensive to develop and maintain</li> <li>• Requires strong nexus</li> <li>• Increases mitigation costs for developers because it increases feasible mitigation options</li> <li>• Limited to jurisdictional boundary unless a regional authority is created</li> <li>• Uncertainty about feasibility and strength of nexus relationship between VMT and pedestrian, bicycle, and transit projects (especially in suburban/rural jurisdictions)</li> </ul>
Mitigation Exchange	<ul style="list-style-type: none"> <li>• Limited complexity</li> <li>• Reduced nexus obligation</li> <li>• Expands mitigation to include costs for programs, operations, and maintenance</li> <li>• Allows for regional scale mitigation projects</li> <li>• Allows for mitigation projects to be in other jurisdictions</li> <li>• Increases potential VMT reduction compared to project site mitigation only</li> </ul>	<ul style="list-style-type: none"> <li>• Requires 'additionality'</li> <li>• Potential for mismatch between mitigation need and mitigation projects</li> <li>• Increases mitigation costs for developers because it increases feasible mitigation options</li> <li>• Unknown timeframe for mitigation life</li> <li>• Effectiveness depends on scale of the program</li> </ul>
Mitigation Bank	<ul style="list-style-type: none"> <li>• Adds certainty to development costs</li> <li>• Allows for regional scale projects</li> <li>• Allows for mitigation projects to be in other jurisdictions</li> <li>• Allows regional or state transfers</li> <li>• Expands mitigation options to include costs for programs, operations, and maintenance</li> <li>• Increases potential VMT reduction compared to project site mitigation only</li> </ul>	<ul style="list-style-type: none"> <li>• Requires 'additionality'</li> <li>• Time consuming and expensive to develop and maintain</li> <li>• Requires strong nexus</li> <li>• Political difficulty distributing mitigation dollars/projects</li> <li>• Increases mitigation costs for developers because it increases feasible mitigation options</li> <li>• Unknown timeframe for mitigation life</li> <li>• Effectiveness depends on scale of the program</li> </ul>

To better understand potential program differences, Table 2 contains a comparison of the VMT mitigation projects or actions that each program type could fund or implement. The information for an impact fee program is more certain than for exchanges or banks. Fee programs have been used in practice for decades and have been vetted through court decisions. While banks and exchanges do exist for other environmental mitigation purposes such as wetlands preservation and habitat conservation, these applications have largely focused on protecting fixed land amounts versus reducing a metric that fluctuates over time and may vary in value depending on economic conditions.

Table 2 –VMT Mitigation Projects and Actions Comparison	
Program Structure	Project Types that Reduce VMT
Impact Fee Program	<ul style="list-style-type: none"><li>• Pedestrian network expansion</li><li>• Bicycle/Scooter network expansion (includes bike/scooter share stations)</li><li>• Transit vehicles or facilities associated with service expansion</li><li>• Roadway gap closures that reduce trip lengths (bridges)</li></ul>
Mitigation Exchange	<ul style="list-style-type: none"><li>• All impact fee program project types</li><li>• Private or institutional projects that reduce VMT</li><li>• Transit service improvements and transit pass subsidies</li></ul>
Mitigation Bank	<ul style="list-style-type: none"><li>• All impact fee program project types</li><li>• All mitigation exchange project types</li><li>• VMT reduction strategies associated with travel behavior changes</li></ul>

## **IMPLEMENTATION STEPS**

This section addresses the second objective noted above to outline the implementation steps associated with creating an exchange or bank to help identify key implementation questions or issues that could affect their feasibility. The starting point for these steps begins with identifying the potential statutory or legal requirements that could govern or influence program creation. These are highlighted in Table 3 and build on the research previously done by U.C. Berkeley in the document referenced above. Since specific statutes do not exist specific to VMT exchanges and banks, U.C. Berkeley used a proxy based on conservation programs established under the California Fish & Game code. This is a reasonable proxy given that the intent behind VMT exchanges and banks is a form of conservation. Instead of habitat, VMT exchanges and banks are trying to conserve vehicle trip making and the VMT generated through this activity. VMT mitigation banks or exchanges do not appear to require new legislative authority but as noted in the U.C. Berkeley document, having state-wide templates for their development could help establish clear standards and expectations for program designs.

**Table 3 – Potential VMT Mitigation Exchange/Bank Legal Requirements**

Program Type/Legal Requirements	Statutory Reference
<b>Transportation Impact Fee Program</b>	
<p>1. Mitigation Fee Act – Intended to create a program that allows individual development projects to pay for all or portion of the cost to implement public facilities necessary to support the project. Public facilities are generally limited to capital projects. The nexus study for the program must demonstrate how there is a reasonable relationship between the following.</p> <ul style="list-style-type: none"> <li>• How there is a reasonable relationship between the fee's use and the type of development project on which the fee is imposed.</li> <li>• How there is a reasonable relationship between the need for the public facility and the type of development project on which the fee is imposed.</li> <li>• How there is a reasonable relationship between the amount of the fee and the cost of the public facility or portion of the public facility attributable to the development on which the fee is imposed.</li> </ul> <p>The fees may not be applied to existing deficiencies or the maintenance and operation of an improvement. As such, clear standards should exist about the physical and operational performance expectations for each model of travel included in the program.</p>	<ul style="list-style-type: none"> <li>• California Government Code §66000-66001</li> </ul>
<p>2. Constitutional – Court decisions have placed limits on what level of mitigation can be expected of land use development projects. The limits largely require a nexus between the mitigation and a legitimate government interest plus a rough proportionality between the mitigation and the adverse impact caused by the project.</p>	<ul style="list-style-type: none"> <li>• Nollan v. California Coastal Commission, 483 U.S. 825 (1987)</li> <li>• Dolan v. City of Tigard, 512 U.S. 374 (1994)</li> </ul>
<p>3. CEQA – For mitigation to be imposed, a significant impact must occur. Impacts stem from changes to the baseline environment caused by the project. The significance of those impacts is determined by the lead agencies choice of thresholds. This limits mitigation to increment of VMT change that occurs above the threshold.</p>	<ul style="list-style-type: none"> <li>• CEQA Statute (CA Public Resources Code 21000-21189)</li> <li>• CEQA Guidelines (CA Code of Regulations, Title 14, Division 6, Chapter 3, Sections 15000-15387)</li> </ul>
<b>VMT Mitigation Exchange or Bank</b>	
<p>1. An explanation of the VMT mitigation purpose of and need for the bank or exchange.</p>	<ul style="list-style-type: none"> <li>• Fish &amp; Game Code §1852(c)(1)</li> </ul>

**Table 3 – Potential VMT Mitigation Exchange/Bank Legal Requirements**

Program Type/Legal Requirements	Statutory Reference
2. The geographic area covered by the bank or exchange and rationale for the selection of the area, together with a description of the existing transportation and development dynamics that provide relevant context for the development of the bank or exchange.	•§1852(c)(2)
3. The public transit and VMT reduction opportunities currently located within the bank or exchange area.	•§1852(c)(3)
4. Important residential and commercial communities and transportation resources within the bank or exchange area, and an explanation of the criteria, data, and methods used to identify those important communities and resources.	•§1852(c)(4)
5. A summary of historic, current, and projected future transportation stressors and pressures in the bank or exchange area, including economic, population growth and development trends.	•§1852(c)(5-6)
6. Provisions ensuring that the bank or exchange will be in compliance with all applicable state and local legal and other requirements and does not preempt the authority of local agencies to implement infrastructure and urban development in local general plans.	•§1852(c)(7)
7. VMT mitigation goals and measurable objectives for regional transportation resources and important mitigation elements identified in the plan that address or respond to the identified stressors and pressures on transportation within the bank or exchange area.	•§1852(c)(8)
8. VMT mitigation projects, including a description of specific projects that, if implemented, could achieve the mitigation goals and objectives, and a description of how the mitigation projects were prioritized and selected in relation to the mitigation goals and objectives.	•§1852(c)(9)
9. Provisions ensuring that the bank or exchange plan is consistent with and complements any local, regional or federal transportation or congestion management plan that overlaps with the bank or exchange area, a summary of any such plans, and an explanation of such consistency.	•§1852(c)(10-11)
<p>Sources:</p> <p><u>Implementing SB 743 An Analysis of Vehicles Miles Traveled Banking and Exchange Frameworks</u>, October 2018, Institute of Transportation Studies, U.C. Berkeley.</p> <p><u>2019 California Environmental Quality Act (CEQA) Statute &amp; Guidelines</u>, Association of Environmental Professionals, 2019.</p> <p><a href="http://leginfo.ca.gov/">http://leginfo.ca.gov/</a> <a href="http://ccr.oal.ca.gov/">http://ccr.oal.ca.gov/</a></p>	

A review of these potential legal requirements suggests that the creation of an exchange or a bank may not be less rigorous than that of a conventional transportation impact fee program. These legal requirements combined with the need to demonstrate additionality and provide verification could create implementation costs beyond those of a conventional transportation impact fee program. To explore this issue further, annotated flow charts were developed for each program concept. These flow charts are presented on the following pages and allow a reviewer to quickly surmise the differences and similarities associated with creating, operating, and maintaining these programs.

## VMT Impact Fee

### Implementation

#### Step 1 Determine Scale/Scope

#### Step 2 Determine Nexus (VMT)

#### Step 3 Determine & Propose Mitigation Options

#### Step 4 Prepare & Approve Nexus Study

#### Step 5 Prepare & Adopt Fee Ordinance

#### Step 6 Complete CEQA Review for the Program

#### Step 7 Administer the Program

### Considerations

To create a regional program requires all participating agencies to adopt the program. Programs with larger scopes:

- \*Decrease administrative costs
- \*Decrease local authority
- \*Increase efficiency and effectiveness of the program

An agency must determine its VMT reduction goal before it can show the relationship between new development and that goal.

The CIP develops a list of capital improvement projects necessary to reduce VMT consistent with its desired goal. The agency should prioritize the projects so they are constructed in a logical order.

The prioritization process should consider:

- \*Equity
- \*Timeliness
- \*Cost
- \*Modal Preference (Walking/Biking/Transit)
- \*Stakeholder/Community Input

Agencies must demonstrate that the projects in the fee program contribute to VMT reduction. The agency must also show that the fees are related and proportional to new development.

Fees should take into account the delay in the time when fees are collected and when they are used.

For a fee to be regularly imposed, it must be adopted as an ordinance.

The ordinance must include:

- \*Reason for the fee
- \*The relationship between the fee and new development
- \*Methodology used in developing the fee
- \*Projects to be included in the CIP

California courts have ruled that in order for a fee program to serve as acceptable CEQA mitigation, the program itself must first be reviewed in an EIR.

For Regional Impact Fee Programs ensure that participating agencies have adopted the program such that payment of fees is considered a feasible mitigation measure.

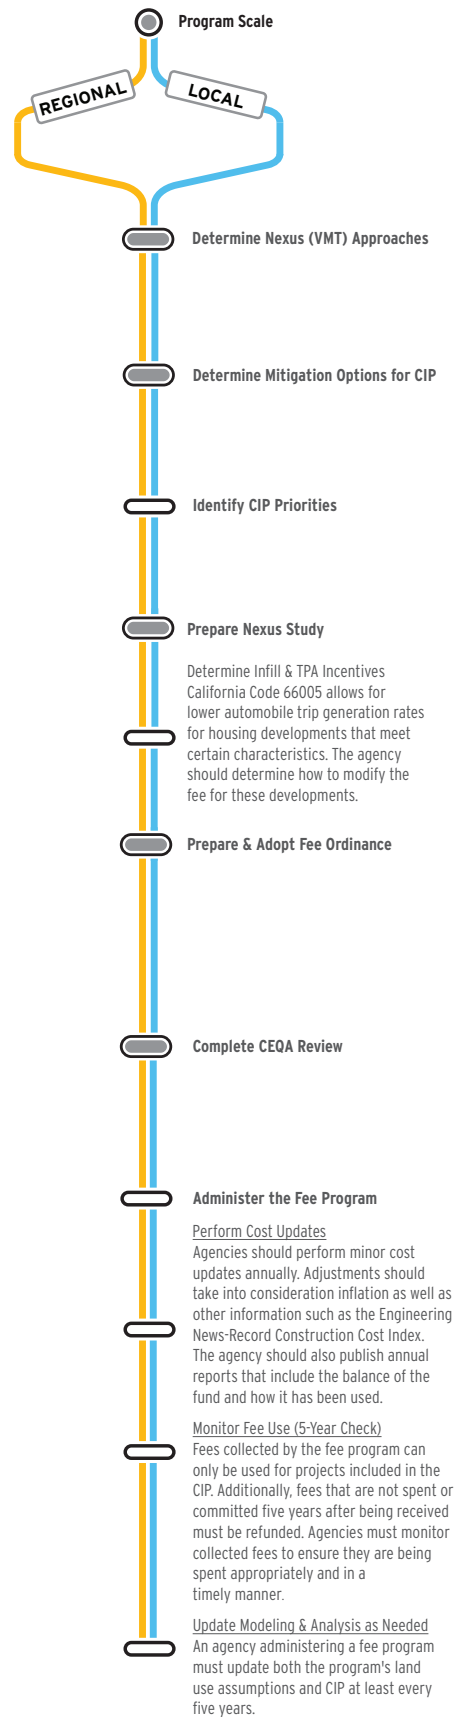

### Procedural Flowchart

Decision

Analytical process or procedural outcome

## VMT Exchange

### Implementation

#### Step 1 Determine Scale/Scope

#### Step 2 Determine Sponsor

#### Step 3 Determine & Propose Mitigation Options

#### Step 4 Develop Review Team

#### Step 5 Administer Exchange

### Considerations

To create a regional program requires all participating agencies to adopt the program. Programs with larger scopes can:

- \*Decrease administrative costs
- \*Decrease local authority
- \*Increase efficiency and effectiveness of the program

The organizational components of a mitigation Exchange will depend on the type of sponsor (public or private) mitigation options, and matching process between mitigation options and projects.

If the sponsor is a public agency, they will develop a list of options developers can choose from to mitigate the VMT generated by their development.

If the developer wants to propose their own mitigation exchange, they must get it approved by the sponsor and lead agency.

The Exchange should have a Review Team to verify mitigation effectiveness and additionality based on substantial evidence. The team could consist of third-party representatives. The team reviews the mitigation list and verifies that the options reduce VMT and that the reductions would not have occurred without the project, program, or incentive.

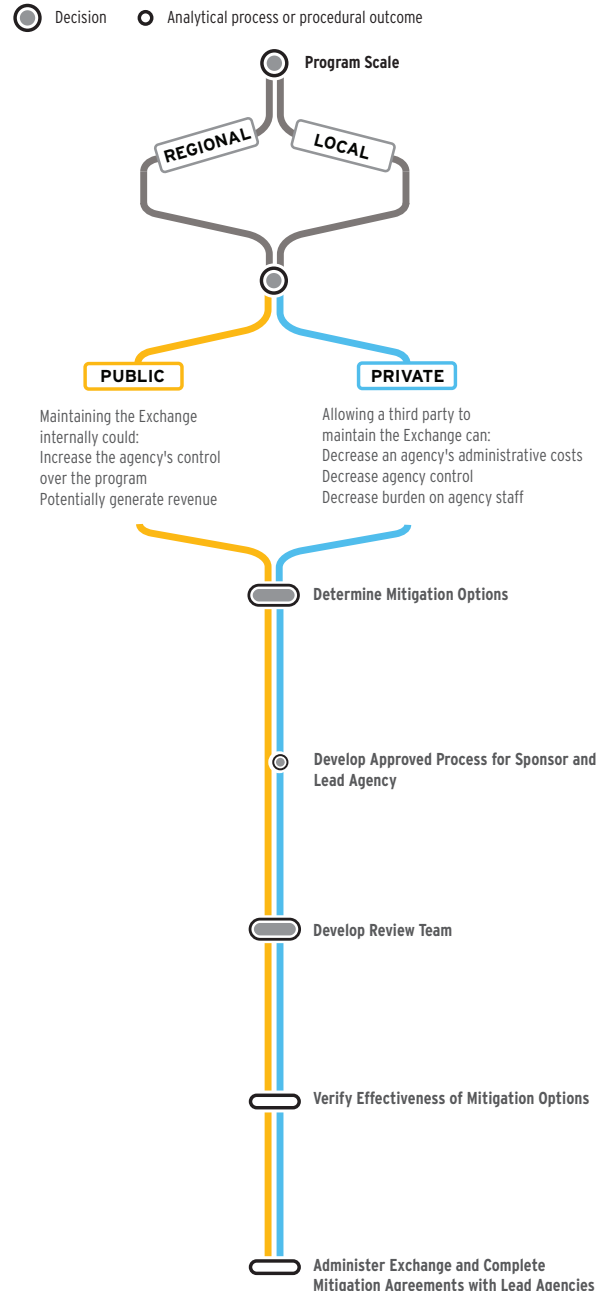

Because Exchanges can include programs/incentives as mitigation options, the Review Team must continually evaluate them to ensure the options are still effective and determine to what degree they reduce VMT.

The public agency/entity sponsoring an Exchange may not always be the lead agency on a project. In this situation the Sponsor should develop an agreement with the lead agency that allows the Exchange's mitigation options to be considered an acceptable mitigation measure for the EIR.

Exchanges must continue to prove that their mitigation options reduce VMT and that the reduction would not have occurred without the projects/programs.

CEQA review of the Exchange creation may be required to be considered as a formal mitigation program.

### Procedural Flowchart

## VMT Bank

### Implementation

#### Step 1 Determine Scale/Scope

#### Step 2 Determine Sponsor

#### Step 3 Formally Establish Bank & Review Team

#### Step 4 Determine & Prioritize Mitigation Options

#### Step 5 Administer Bank

### Considerations

There are advantages and disadvantages to creating a Bank with a larger scale/scope. However, multiple agencies must be willing to accept the Bank's mitigation options for a state or regional Bank to be feasible. Larger regions can:

- \*Decrease costs associated with running the Bank
- \*Decrease local authority over mitigation options
- \*Increase efficiency and effectiveness of the program

There are a few organizational components to consider when creating a mitigation Bank. These elements include:

\*Administrative - The Bank must perform several administrative functions such as collecting fees, managing information, answering questions, and other business operations.

\*Technical - There is a significant amount of technical work needed to initially and continually prove the mitigation options reduce VMT and that the reductions would not have occurred without the programs. The Bank also needs to show the fees it receives are related and proportional to new development.

\*Accounting - The Bank requires a thorough accounting system to track collected fees and to ensure fees are being handled according to CEQA and other legal guidelines. This includes payments for implementing VMT reduction projects.

Agencies should consider their ability to perform these roles when deciding whether the Bank should be run internally or by a third party.

The entity creating the Bank must legally formalize its creation. If the intent is for the Bank to be used by multiple agencies, this may require a joint powers authority or equivalent.

A review team should be used to verify the effectiveness of mitigation options based on substantial evidence. This team could be internal to the entity creating the bank or an independent third party.

Potential third party entities that could function as a review team include public agencies such as those listed below.

- \*Caltrans - local office
- \*ARB
- \*CalEPA

The Bank Sponsor creates a list of mitigation options. The Review Team evaluates the list to ensure it complies with relevant requirements. The Sponsor should consider the following elements when prioritizing options:

- \*Equity
- \*Timeliness of Implementation
- \*Cost

Mitigation options can include:

- \*Infrastructure projects
- \*Programs/incentives (Unlike infrastructure projects, programs/incentives are ongoing activities. Because programs/incentives must be continually maintained to be effective, agencies should consider if developers must pay for them indefinitely.

The public agency or entity sponsoring a Bank may not always be the lead agency on a project. In this situation the Sponsor should develop an agreement with the lead agency that allows the Bank's mitigation options to be considered an acceptable mitigation measure for the EIR.

Banks must continue to prove that their mitigation options reduce VMT and that the reduction would not have occurred without the projects/programs.

CEQA review of the Exchange creation may be required to be considered as a formal mitigation program.

### Procedural Flowchart

Decision

Analytical process or procedural outcome

## **PROGRAM EXAMPLES**

To help explain the different program types, it may be useful to consider some examples. While no VMT mitigation exchanges or banks currently exist, the examples below could function as one with appropriate modifications to comply with the implementation steps noted above.

### **City of Los Angeles Westside Mobility Plan Transportation Impact Fee Program**

(<https://planning.lacity.org/eir/CoastalTrans/deir/pdfs/tiafeestudy.pdf>)

The City of Los Angeles developed the first impact fee program that relies on a VMT reduction nexus. The westside previously relied on LOS-based impact fee programs but as the area matured and new laws like SB 743 emerged, the City choose to shift their nexus. This shift changed the nature of the CIP from largely roadway capacity expansion projects to more transit, bicycle, and pedestrian infrastructure projects. A key benefit of this approach as noted above is that once the fee program is in place, administration of the program is limited to construction cost updates and complying with state reviews to ensure that funding is being appropriately used to construct and implement the CIP projects. No further verification of CIP effectiveness is required.

### **Miles**

(<https://www.sacrt.com/apps/miles-get-rewarded-for-your-commute-travel/>)

The City of Sacramento, Sacramento Regional Transit, and Sacramento State partnered with [Miles](#), a new app that will reward you miles for all of your commute and travel. Miles app users automatically earn miles for daily travel and are rewarded bonus miles for green trips (walk, bike, carpool or transit). Sacramento residents are also eligible to complete special challenges to earn additional rewards. While this program was not set up as an VMT mitigation exchange or bank, it could evolve into one.

The purpose of rewarding green trips and the special challenges is to influence user behavior to reduce vehicle trips and VMT. With some additional accounting of user travel behavior before and after using the app, enough substantial evidence could be created to provide the VMT reduction verification described above and noted in the flow charts. The program already has administrative functions developed and established relationships between the partner agencies. Some of the unknowns at this time are listed below.

- cost of the program on a per user basis
- amount of VMT reduction that is achieved for a typical user
- how a developer could contribute to the program to sponsor additional users
- stability or permanency of VMT reductions dependent on 'challenges'

In addition to the Miles program, other similar vendors exist such as Luum (<https://luumbenefits.com/>) and Metropia (<https://www.metropia.com/>). These type of app-based vendors could evolve to offer Exchange or Bank type mitigation options if they can comply with the various requirements outlined in the implementation steps and identified in the U.C. Berkeley white paper cited above.

### **Metro Transit Pass Subsidy**

Metro is the Los Angeles County mobility provider. One of the programs they currently offer is a transit pass subsidy with a couple of unique elements that may qualify it as a VMT mitigation exchange. Metro offers student and employee transit passes under their U-pass and E-pass programs. These are transit passes for students and employees in LA County that are unique because instead of a physical transit pass card, the pass comes in the form of an RFID chip with an antenna that sticks to an existing student or employee identification badge. This type of chip allows the transit agency to charge for trips when they are made, which is more cost-effective for schools and employers. The registration form for obtaining the pass includes a survey about current travel behavior and data such as the distance between home and school or work for the applicant. By tracking how individual travel behavior changes from this baseline condition over time, LA Metro can produce aggregate statistics about the effect on transit ridership and VMT.

The second unique component of the program is that Metro allows anyone to 'sponsor' these passes for a particular school or employer. As such, they are entertaining the concept of using the program as an SB 743 VMT Mitigation Exchange. Developers could purchase U- or E-passes and could use the Metro performance data to estimate the VMT reduction per pass. LA Metro is working with LA DOT and SCAG on a pilot concept this year to formalize the program. As part of this white paper development, we asked Metro if developers/agencies outside Los Angeles County could participate. The reason for this request is that VMT mitigation dollars spent on Metro transit passes may be more effective than the same dollars spent in other communities. Whether local communities would be willing to allow mitigation dollars across borders will likely depend on a variety of factors but knowing that it is feasible on the Metro end is an important first feasibility question. Metro replied that their work has not progressed sufficiently to answer this question yet.

### **IMPLEMENTATION RISKS**

As explained above, VMT exchanges or banks come with unique requirements such as the 'additionality' test and ongoing verification that make them more challenging to implement than a conventional transportation impact fee program. However, exchanges and banks offer the ability to include program-

type strategies directed at changing travel behavior that are not available in a conventional impact fee program. Given these tradeoffs, we assessed whether other risks could influence the choice of program.

One risk that stood out was related to current legal challenges to the use of carbon offsets that are based on similar concepts. In a recent legal case, the Sierra Club, Center for Biological Diversity, and Cleveland National Forest Foundation, Climate Action Campaign, Endangered Habitats League, Environmental Center of San Diego, and Preserve Wild Santee challenged the County of San Diego over the use of carbon offsets to achieve GHG reduction goals in the County's climate action plan. The court petition is available at the link below.

- <https://www.biologicaldiversity.org/programs/urban/pdfs/San-Diego-CAP-Petition-for-Writ-of-Mandate.pdf>

The California Attorney General's (AG's) office has also weighed in on this court case. According to a November 11, 2019 Los Angeles Times article, "California say San Diego County could undermine state's greenhouse gas plan", the AG's office filed an amicus brief. The article reported the following about the AG's brief.

*In a strongly worded amicus brief recently submitted to the 4th District Court of Appeal in San Diego, Becerra argued that the county's offset strategy would "perpetuate current sprawling development patterns, which will impede the ability of the region and state to reach their long-term climate objectives."*

*"Without significant [vehicle miles traveled] reductions across the state, California simply will not be able to achieve its [greenhouse gas] reduction targets," the 33-page document said.*

The state does not appear to support reducing GHG emissions from land use development without those reductions coming from fundamental local land use and transportation network changes. The risk is that lower density suburban and rural parts of the state would continue their sprawling patterns leading to more VMT and emissions. If the state maintains this position, it could also be used to argue against the creation of VMT mitigation exchanges and banks that attempt to offset VMT increases. To minimize this risk, the mitigation options offered by exchanges and banks could be applied only after project site mitigation has been exhausted and should attempt to offer additional mitigation within the same area or community.

A WHITE PAPER PREPARED BY

FEHR & PEERS

JANUARY 2020 | DRAFT

# **Appendix K: Comparison of CAPCOA Strategies Versus New Research Since 2010**

Comparison of CAPCOA Strategies Versus New Research Since 2010

CAPCOA Category	CAPCOA #	CAPCOA Strategy	CAPCOA Reduction	Strength of Substantial Evidence for CEQA Impact Analysis?	New Information Since CAPCOA Was Published in 2010		
					New information	Change in VMT reduction compared to CAPCOA	Literature or Evidence Cited
Land Use/Location	3.1.1	LUT-1 Increase Density	0.8% - 30% VMT reduction due to increase in density	Adequate	<p>Increasing residential density is associated with lower VMT per capita. Increased residential density in areas with high jobs access may have a greater VMT change than increases in regions with lower jobs access.</p> <p>The range of reductions is based on a range of elasticities from -0.04 to -0.22. The low end of the reductions represents a -0.04 elasticity of demand in response to a 10% increase in residential units or employment density and a -0.22 elasticity in response to 50% increase to residential/employment density.</p>	0.4% -10.75%	<p>Primary sources: Boarnet, M. and Handy, S. (2014). Impacts of Residential Density on Passenger Vehicle Use and Greenhouse Gas Emissions - Policy Brief and Technical Background Document. California Air Resources Board. 					New information	Change in VMT reduction compared to CAPCOA	Literature or Evidence Cited
Land Use/ Location	3.1.3	LUT-3 Increase Diversity of Urban and Suburban Developments	9%-30% VMT reduction due to mixing land uses within a single development	Adequate	1] VMT reduction due to mix of land uses within a single development. Mixing land uses within a single development can decrease VMT (and resulting GHG emissions), since building users do not need to drive to meet all of their needs. 2] Reduction in VMT due to regional change in entropy index of diversity. Providing a mix of land uses within a single neighborhood can decrease VMT (and resulting GHG emissions), since trips between land use types are shorter and may be accommodated by non-auto modes of transport. For example when residential areas are in the same neighborhood as retail and office buildings, a resident does not need to travel outside of the neighborhood to meet his/her trip needs. At the regional level, reductions in VMT are measured in response to changes in the entropy index of land use diversity.	1] 0%-12%  2] 0.3%-4%	1] Ewing, R. and Cervero, R. (2010). Comparison of CAPCOA Strategies Versus New Research Since 2010

CAPCOA Category	CAPCOA #	CAPCOA Strategy	CAPCOA Reduction	Strength of Substantial Evidence for CEQA Impact Analysis?	New Information Since CAPCOA Was Published in 2010		
					New information	Change in VMT reduction compared to CAPCOA	Literature or Evidence Cited
Parking Pricing	3.3.1	PDT-1 Limit Parking Supply	5%-12.5% VMT reduction in response to reduced parking supply vs. ITE parking generation rate	Weak - not recommended. Fehr & Peers has developed new estimates for residential land use only that may be used.	CAPCOA reduction range derived from estimate of reduced vehicle ownership, not supported by observed trip or VMT reductions. Evidence is available for mode shift due to presence/absence of parking in high-transit urban areas; additional investigation ongoing	Higher	Fehr & Peers estimated a linear regression formula based on observed data from multiple locations. Resulting equation produces maximum VMT reductions for residential land use only of 30% in suburban locations and 50% in urban locations based on parking supply percentage reductions.
Parking Pricing	3.3.2	PDT-2 Unbundle Parking Costs from Property Cost	2.6% -13% VMT reduction due to decreased vehicle ownership rates	Adequate - conditional on the agency not requiring parking minimums and pricing/managing on-street parking (i.e., residential parking permit districts, etc.).	Reduction in VMT, primarily for residential uses, based on range of elasticities for vehicle ownership in response to increased residential parking fees. Does not account for self-selection. Only applies if the city does not require parking minimums and if on-street parking is priced and managed (i.e., residential parking permit districts).	2%-12%	Victoria Transport Policy Institute (2009). Parking Requirement Impacts on Housing Affordability. Retrieved March 2010 from: <a href="http://www.vtpi.org/park-hou.pdf">http://www.vtpi.org/park-hou.pdf</a> .
Parking Pricing	3.3.3	PDT-3 Implement Market Price Public Parking	2.8%-5.5% VMT reduction due to "park once" behavior and disincentive to driving	Adequate	<p>Implement a pricing strategy for parking by pricing all central business district/employment center/retail center on-street parking. It will be priced to encourage park once" behavior. The benefit of this measure above that of paid parking at the project only is that it deters parking spillover from project supplied parking to other public parking nearby, which undermine the vehicle miles traveled (VMT) benefits of project pricing. It may also generate sufficient area-wide mode shifts to justify increased transit service to the area.</p> <p>VMT reduction applies to VMT from visitor/customer trips only. Reductions higher than top end of range from CAPCOA report apply only in conditions with highly constrained on-street parking supply and lack of comparably-priced off-street parking.</p>	2.8%-14.5%	<p>Clinch, J.P. and Kelly, J.A. Comparison of CAPCOA Strategies Versus New Research Since 2010

CAPCOA Category	CAPCOA #	CAPCOA Strategy	CAPCOA Reduction	Strength of Substantial Evidence for CEQA Impact Analysis?	New Information Since CAPCOA Was Published in 2010		
					New information	Change in VMT reduction compared to CAPCOA	Literature or Evidence Cited
Commute Trip Reduction	3.4.3	TRT-3 Provide Ride-Sharing Programs	1%-15% commute VMT reduction due to employer ride share coordination and facilities	Adequate - Effectiveness is building/tenant specific. Do not use with "TRT-1 Implement CTR Program - Voluntary" or "TRT-2 Implement CTR Program - Required Implementation/Monitoring."	Commute vehicle trips reduction due to employer ride-sharing programs. Promote ride-sharing programs through a multi-faceted approach such as: <ul style="list-style-type: none"><li>• Designating a certain percentage of parking spaces for ride sharing vehicles</li><li>• Designating adequate passenger loading and unloading and waiting areas for ride-sharing vehicles</li><li>• Providing an app or website for coordinating rides</li></ul>	2.5%-8.3%	Victoria Transport Policy Institute. (2015). Ridesharing: Carpooling and Vanpooling. Online TDM Encyclopedia. Retrieved from: <a href="http://vtpi.org/tdm/tdm34.htm">http://vtpi.org/tdm/tdm34.htm</a>
Commute Trip Reduction	3.4.10	TRT-10 Implement a School Pool Program	7.2%-15.8% reduction in school VMT due to school pool implementation	Adequate - School VMT only.	Limited new evidence available, not conclusive	Same	Transportation Demand Management Institute of the Association for Commuter Transportation. TDM Case Studies and Commuter Testimonials. Prepared for the US EPA. 1997. (p. 10, 36-38)  WayToGo 2015 Annual Report. Accessed on March 12, 2017 from <a href="http://www.waytogo.org/sites/default/files/attachments/waytogo-annual-report-2015.pdf">http://www.waytogo.org/sites/default/files/attachments/waytogo-annual-report-2015.pdf</a>
Commute Trip Reduction	3.4.13	TRT-13 Implement School Bus Program	38%-63% reduction in school VMT due to school bus service implementation	Adequate - School VMT only.	VMT reduction for school trips based on data beyond a single school district.  School district boundaries are also a factor to consider. VMT reduction does not appear to be a factor that was considered in a select review of CA boundaries.  VMT reductions apply to school trip VMT only.	5%-30%	Wilson, E., et al. (2007). The implications of school choice on travel behavior and environmental emissions. Transportation Research Part D: Transport and Environment 12(2007), 506-518.
Not Applicable - not a CAPCOA strategy	Not Applicable - not a CAPCOA strategy	Not Applicable - not a CAPCOA strategy	Not Applicable - not a CAPCOA strategy	Not Applicable - not a CAPCOA strategy	Bikeshare car trip substitution rate of 7-19% based on data from Washington DC, and Minneapolis/St. Paul. Annual VMT reduction of 151,000 and 57,000, respectively. Includes VMT for rebalancing and maintenance.  VMT reduction of 0.023 miles per day per bikeshare member estimated for Bay Area bikeshare, utilizing Minneapolis/St. Paul data from study above.	57,000-151,000 annual VMT reduction, based on two large US cities.  VMT reduction of 0.023 miles per day per member, based on one large US city estimate.	Fishman, E., Washington, S., & Haworth, N. (2014). Bike share's impact on car use: Evidence from the United States, Great Britain, and Australia. Transportation Research Part D: Transport and Environment, 31, 13-20.  TDM Methodology: Impact of Carsharing Membership, Transit Passes, Bikesharing Membership, Unbundled Parking, and Parking Supply Reductions on Driving. Center for Neighborhood Technology, Peter Haas and Cindy Copp, with TransForm staff, May 5, 2016.
